U.S. Army Garrison Fort Wainwright
Fort Wainwright, AK

ACKNOWLEDGEMENTS

The successful completion of the 2010 and 2011 field seasons was only made possible by personnel who contributed valuable labor and expertise to these efforts. Working in remote areas of the Tanana Valley presents its own brand of hardships and adversity. That they continued to discover archaeological sites and collect high-quality data despite these adversities is a testament to their work ethic, tenacity, and professionalism. With the deepest appreciation, we graciously thank:

2010

Brian Beringer
Laura Dice
Aimee Ely
James Kunesh*
Whitney McLaren
Josh Noyer
Mike Shimel*
Patrick Vincent
Kate Yeske*

*Crew Chief

2011

Nathan Barnes
Elizabeth Carroll
Matt Dighton
Lindsay Doyle
Maegan Ellicott
Heather Hardy*
Haley McCaig
Whitney McLaren*
Ally Pelto
Jim Quinn*
Charlie Rose
Benjamin Storey*
Dan Stryker
Matt Terry*
Kate Yeske*

In addition, we also graciously thank Scott Shirar for the identification of faunal remains found at site FAI-02043 and Jeff Rasic for his assistance with ongoing elemental analysis of the obsidian artifacts recovered during 2010 and 2011.

List of Acronyms

AHRS – Alaska Heritage Resource Survey
ANC – Anchorage
APE – Area of Potential Effect
ARPA – Archaeological Resources Protection Act
ATV – All Terrain Vehicles
BP – Years before Present
BRTA – Black Rapids Training Area
CEMML – Center for Environmental Management of Military Lands
cm – centimeter
cm BS – Centimeters below Surface
CMT – Culturally Modified Tree
CRM – Cultural Resources Manager
DEM – Digital Elevation Model
DOE – Determination of Eligibility
DTA – Donnelly Training Area
FAI – Fairbanks
FP – Firing Point
FRA – Fort Richardson
FS – Field Specimen
FWA – Fort Wainwright
GRTA – Gerstle River Training Area
ICRMP – Integrated Cultural Resources Management Plan
ITAM – Integrated Training Area Management
LA-ICP-MS – laser ablation inductively coupled plasma mass spectrometry
m – meter
mm – millimeter
MASL – Meters above Sea Level
MOUT – Military Operations on Urban Terrain
MRE – Meal-Ready-to-Eat
NHPA – National Historic Preservation Act
NRHP – National Register of Historic Places
PDZ – Potential Development Zone
PL – Point Located
SFAC – Soldier Family Assistance Center
SHPO – State Historic Preservation Officer
TARP – Training Area Restoration Plan
TFTA – Tanana Flats Training Area
UAC – Urban Assault Course
USAG – U. S. Army Garrison
USARAK – U. S. Army Alaska
USARAL – U. S. Army Alaska (historic)
USGS – U. S. Geological Survey
UTM – Universal Transverse Mercator

UXO – Unexploded Ordinance

WT – Warrior in Transition

XRF – X-ray fluorescence

XBD – Big Delta

XMH – Mt. Hayes

YTA – Yukon Training Area

1.0 INTRODUCTION

Section 110 of the National Historic Preservation Act (NHPA: 16 U.S.C. 470) states that every federal agency must establish a preservation program for the identification, evaluation, nomination of sites to the National Register, and protection of historic properties. Although Army Regulation 200-1 requires full compliance with federal law, most Section 110 inventories and evaluations in Army training lands take place in coordination with Section 106 reviews of project undertakings. In recent years, Fort Wainwright's Cultural Resource Manager (CRM) has begun a consultation process with Range Control at Fort Wainwright (FWA) and Donnelly Training Area (DTA) to establish potential development zones (PDZs) based upon projected training needs. FWA and DTA are two large tracts of military managed land outside the FWA main post cantonment area. These PDZs are areas with no immediate undertakings, but regions that the Army plans to develop in the 2-10 year time range. Identification of PDZs has allowed the CRM to focus archaeological survey efforts, in addition to 106 projects, in the areas of FWA's 1.6 million acres considered most necessary.

The purpose of this report is twofold. First, it provides information on survey locations and archaeological site discoveries in FWA and its training lands during 2010 and 2011 that were not associated with Army undertakings and therefore not seen by the SHPO in Section 106 letters. Second, it summarizes all survey efforts by the Army's cooperative partner, Colorado State University's Center for Environmental Management of Military Lands (CSU-CEMML), since 2002 and lists all known sites managed by FWA.

Because this report summarizes all archaeological surveys and site identification from 2010 and 2011, some sites will have already been reported to the SHPO in Section 106 consultation letters. These sites are marked to differentiate them from sites that have not yet been reported.

All archaeological fieldwork was conducted by CEMML employees under the direct supervision of archaeologists meeting the professional standards outlined in the Secretary of the Interior's "Professional Qualifications Standards" as defined in 36 CFR §61. In 2010, all work was supervised by Edmund Gaines, M.A., and in 2011 all work was supervised by Julie Esdale, Ph.D. Three crews comprised of three to five archaeologists conducted the fieldwork.

1.1 Setting and Environment

FWA consists of the Main Post cantonment area and associated training lands, which include three main areas: the Yukon Training Area (YTA), the Tanana Flats Training Area (TFTA), and the Donnelly Training Area (DTA). These are located in central Alaska, north of the Alaska Range in the Tanana River Valley (Figure 1). The post lies 120 miles south of the Arctic Circle near the cities of Fairbanks and North Pole in the Fairbanks North Star Borough. FWA has the northern continental climate of the Alaskan Interior, characterized by short, moderate summers; long, cold winters; and little precipitation or humidity. Average monthly temperatures in Fairbanks range from -11.5° F in January to 61.5° F in July, with an average annual temperature of 26.3° F. The record low temperature is -66° F and the record high is 98° F. Average annual precipitation is 10.4", most of which falls as rain during summer and early fall. Average annual snowfall is 67", with a record high of 168" during the winter of 1970-71 (Natural Resources Branch 2002).

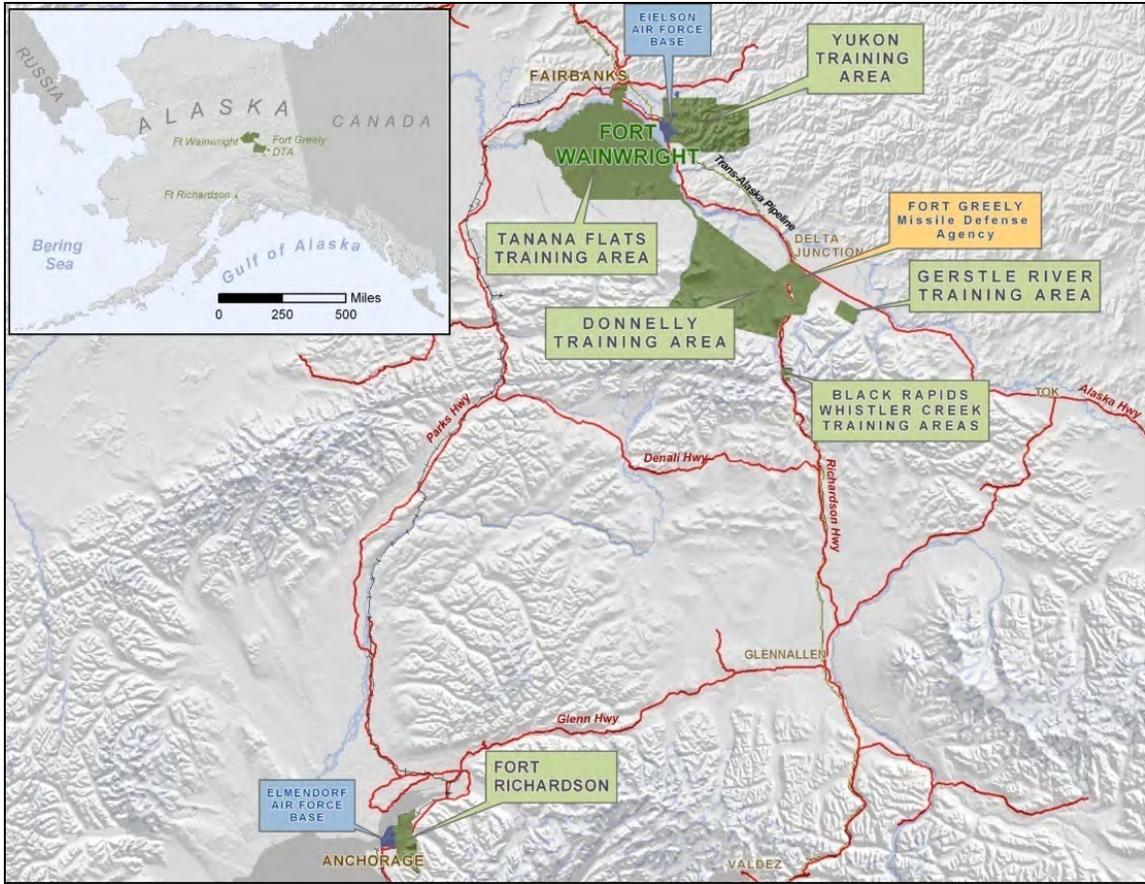

Figure 1. FWA training lands

1.2 Previous Work and Status of Archaeological Resources

Archaeological research on FWA training areas has resulted in numerous technical reports that provide information on surveyed areas and archaeological sites in military lands (Bacon 1979; Bacon and Holmes 1979; Dixon et al. 1980; Esdale and Robertson 2007; Espenshade 2010; Bradley et al. 1973; Gaines 2009; Gaines et al. 2010, 2010; Hedman et al. 2003; Higgs et al. 1999; Holmes 1979; Johnson and Bozarth 2008; Marshall 2007; Potter 2005; Potter et al. 2000; Rabich and Reger 1978; Raymond-Yakoubian 2006; Raymond-Yakoubian and Robertson 2005; Robertson 2010; Robertson et al. 2004, 2006, 2007, 2008, 2009; Staley 1993) and several scientific papers (Holmes and Anderson 1986; West 1967, 1975).

FWA and its training lands contain 636 known archaeological sites and 4 archaeological districts. Sixty sites are eligible for the National Register of Historic Properties (NRHP), 512 sites have not been evaluated, and 64 additional sites have been determined ineligible for the NRHP. Of the eligible or un-evaluated sites, 12 are historic sites and 560 are prehistoric sites.

Archaeological surveys of the FWA Main Post area began in 1979. Jim Dixon surveyed the north side of the Chena River and Birch Hill area, discovering and relocating several prehistoric archaeological sites (FAI-40, 41, 42, 43, 199, and 200) (Dixon et al. 1980). Surveys of the Main Post building areas continued in the 1980s by Julia Steele (Steele 1992, 1983) and Georgeanne

Reynolds (Reynolds 1983, 1985). No sites were found in these previously disturbed areas. John Cook surveyed the River Road pond in 1996 and found one site (FAI-509), which has failed to be relocated in subsequent attempts. In 2001, the Army began contracting cultural resource surveys and evaluations with Colorado State University's Center for Environmental Management of Military Lands (CEMML). Surveys by several different principal investigators have targeted areas of construction undertakings. Two historic sites (FAI-1603 and 1604) and one additional prehistoric site (FAI-1990) were found in these investigations. In 2011, CEMML completed surveys of the entire cantonment, north and south of the Chena River, discovering one additional historic site (FAI-2117). Of the 11 archaeological sites known from the FWA cantonment, 2 (FAI-1603 and 1604) have been determined not eligible. The remaining sites have not yet been evaluated.

Archaeological sites were first identified in the Tanana Flats Training Area (TFTA) in 1973 by Zorro Bradley and others who conducted a survey in the Blair Lakes area (Bradley et al. 1973). James Dixon continued surveys for archaeological district designations in the regions of Blair Lakes (District FAI-335), Clear Creek Butte (District FAI-336), and Wood River Buttes (District FAI-337) (Dixon et al. 1980). In 1993, proposed work in the Clear Creek Butte area prompted a contract to relocate several archaeological sites (Staley 1993.) These three districts have been revisited by CEMML archaeologists a few times over the last decade, and notably 92 new sites were found in 2009-2010 during survey of the Wood River Buttes, Salmon Loaf, and north and east of Blair Lakes. In total, archaeologists have identified 147 archaeological sites in TFTA. Of these sites, 11 have been determined eligible for inclusion in the National Register (FAI-44, 45, 46, 48, 49, 54, and 194 to 198), 2 are not eligible (FAI-1607 and 2046), and 134 remain to be evaluated for eligibility.

The road system in the Yukon Training Area (YTA) was the first of many areas to be investigated. Charles Holmes discovered 8 sites in a 1978 road survey (Holmes 1979). John Cook conducted a Determination of Eligibility (DOE) evaluation on one of these sites in 1979 (Cook 1979.) Michael Kunz surveyed the Stuart Creek area in 1992 but discovered no archaeological sites, and Northern Land Use Research's 1999 survey of Stuart Creek and the YTA road system uncovered one historic site (Higgs et al. 1999). CEMML archaeologists have been surveying portions of YTA in conjunction with construction projects on an annual basis since 2001. Currently, North Beaver Creek, Skyline, Johnson, Quarry, Brigadier, and Manchu roads in YTA are almost entirely surveyed, as is the area east of Skyline Road outside of the Stuart Creek Impact Area, McMahan Trench, the Manchu Range, and the majority of Training Areas 307 and 310, north and south of Manchu and Quarry roads. Twenty archaeological sites have been identified in YTA. Ten of the sites have been determined not eligible for listing in the National Register (FAI-157, XBD-93, 94, 95, 103, 104, 186, 260, 264, and 266), and ten have not been evaluated. XBD-162 will not be evaluated due to its location in a heavily used portion of the Stuart Creek Impact Area.

Archaeological investigations in what is now the Donnelly Training Area began in the 1960s, when Frederick West was searching for sites related to the first Americans (West 1967). He excavated the Donnelly Ridge site (XMH-5) in 1964 and found an assemblage containing microblade core technology similar to early Holocene Denali Complex sites. Several surveys of Ft. Greely and adjacent training lands in the late 1970s documented 64 new sites (Rabich and

Reger 1977; Bacon 1979; Holmes 1979; Bacon and Holmes 1979). Julia Steele surveyed various locations in DTA from 1980-1983, finding four additional new sites (Steele 1980, 1980, 1982, 1982, 1983, and 1983), and Georgianne Reynolds surveyed the Donnelly Dome area in 1988, locating one more (Reynolds 1988). Investigations in DTA from 1992-2002 were by D. Staley (Staley 1993), Tony Gamza (Gamza 1995), Andrew Higgs (Higgs et al. 1999), and Daniel Odess (Odess 2002). Sixteen new sites were found during this decade of fieldwork, and attempts were made to relocate old sites.

Concentrated efforts to expand survey coverage of DTA East began with CEMML archaeologists in 2002. Over 200 new sites were located in the Texas Range, Donnelly Drop Zone, and Eddy Drop Zone in the first half of the decade. In 2007, one site was found in the northernmost portion of DTA West by Ben Potter and others during survey for the Alaska Railroad Northern Rail Extension Project (Potter et al. 2007). In recent years, CEMML research aimed to evaluate many known archaeological sites in DTA for inclusion in the National Register in conjunction with use of the Battle Area Complex and its surface danger zone. Sites have also been discovered during surveys for road and trail maintenance. Potential expansions into DTA West, west of the Delta River, have prompted recent surveys into new areas such as Molybdenum Ridge, where 21 new sites were discovered in 2011. Because of its remote setting, however, the archaeology of Donnelly West is still poorly understood and represents a gap in USAG FWA's inventory of cultural properties. The Cold Regions Test Center (CRTC) has also contracted with CEMML and others since the last ICRMP to survey areas in DTA West, east of the Little Delta River, and many new archaeological sites have been recorded (Espenshade 2010).

To date, 455 archaeological sites have been identified within DTA. Forty-nine sites have been found to be eligible for the National Register, and 50 were found not eligible. An additional 356 sites remain to be evaluated. Historic archaeology sites are poorly represented in this region, with only six currently known to exist. The Donnelly Ridge District (XMH-388) encompasses Denali sites identified by Frederick West, south and west of Donnelly Dome. Future archaeological studies in DTA will concentrate on completing surveys of 100% of the land in DTA East, conducting DOEs on archaeological sites in high traffic areas, and exploring parts of DTA West that are opening up for expansion of military training activities.

The Gerstle River Training Area and Black Rapids Training Area (GRTA and BRTA), also managed by FWA, have been infrequently utilized by training activities, and very few surveys or identification of archaeological sites have occurred these areas. CEMML archaeologists surveyed two small portions of GRTA in 2011. One prehistoric site (XMH-1359) is previously known from this training area. Two sites, which have not been evaluated for the NRHP, have been discovered in BRTA (XMH-317, 318). Future research is planned for GRTA where military activities are planned to take place in the next five years.

1.3 Prehistoric Context

Interior Alaska has been continuously inhabited for the last 14,000 years, and evidence of this continuum of human activity has been preserved within and around FWA's training lands. Interior Alaska's ice-free status during the last glacial period provided a corridor connecting the Bering Land Bridge and eastern Asia to North America. This allowed small bands of nomadic

peoples to colonize Alaska and the rest of the continent and began a period of habitation in Interior Alaska that has persisted through the entire Holocene, the arrival of European traders in the late 1810s, the Klondike gold rush of the late 19th and early 20th centuries, and the military development of the Interior during the middle of the 20th century. FWA's cantonment and training lands comprise a vast and still relatively un-surveyed region with areas of high potential for yielding evidence of this activity.

Alaska has long been regarded as the gateway to the Americas and has held archaeological interest as the possible location for the oldest archaeological sites in the New World. This is due to more than Alaska's proximity to Asia and ice-free condition at the end of the Pleistocene. Similarities between archaeological assemblages in Siberia and Alaska and the discovery of lanceolate projectile points in the muck deposits around Fairbanks in the early 1900s (which bore a resemblance to Clovis points of some antiquity in the American Southwest) also sparked interest in Alaska as a source area for all Native Americans.

After initial colonization, archaeologists generally divide Interior Alaska's prehistory into three broad archaeological themes: the Paleoarctic Tradition (12,000-6,000 years ago¹), the Northern Archaic Tradition (6,000-1,000 years ago), and the Athabaskan Tradition (1,300-800 years ago) (Potter 2008). Archeological materials from these cultures are generally limited to lithic artifacts such as projectile points, cutting tools, scrapers, waste flakes from tool manufacturing, faunal remains, and hearths.

Reconstructions of paleoecological evidence suggest that the end of the Pleistocene was marked by a warming trend in Interior Alaska that may have contributed to initial colonization of the area (Bigelow and Powers 2001). Several sites in areas surrounding Army lands demonstrate that people began living in Interior Alaska 14,000 years ago. Significant sites in the Tanana Valley dating between 14,000-12,000 years ago include Healy Lake (Bigelow and Powers 2001), Walker Road (Bigelow and Powers 2001), Swan Point (Bigelow and Powers 2001), Mead (Bigelow and Powers 2001), and Broken Mammoth (Bigelow and Powers 2001). There are no sites in Alaska, however, that predate the oldest sites in the contiguous United States, nor do Alaska's oldest sites resemble the Clovis culture (Bigelow and Powers 2001). This makes Alaska's earliest inhabitants questionable ancestors to all Native Americans despite genetic evidence pointing to a north-central Asian homeland (Eshleman et al. 2003). The Younger Dryas cooling event from 13,000-12,000 years ago (Bigelow and Powers 2001) may have led to a temporary population decline (Potter 2008) in the Interior before permanent colonization. The Paleoarctic Tradition is a term now generally used by archaeologists to refer to the earliest settled people known from all over Alaska. It was originally defined by Anderson² (Anderson 1968, 1970) as the earliest microblade-using tradition in the American Arctic, with a proposed relationship to northeast Asian late Pleistocene cultures based on similarities in these distinctive artifact types. Archaeological evidence indicates that early settlers camped on terraces, lake shores, buttes, and bluffs. By using these locations on high ground, they could locate and track prey that included large mammals such as mammoth and bison. Evidence from the Upward Sun River Site, located just 5 km southeast of TFTA, for example, demonstrates that hunter-gatherers

¹ All dates are given in calendar years *before present*.

² Anderson called it the "American Palaeoarctic Tradition," but most researchers use the shortened version.

in Interior Alaska were concentrating on bison and wapiti at the end of the Pleistocene (The Upward Sun River Site is also known for one of the earliest burials in the Americas. [Potter 2008; Potter et al. 2008; Potter et al. 2011]). It is likely that the treeless environment and nomadic nature of these peoples had a direct impact on the kinds of tools they fashioned. Stone, bone, antler, and ivory provided the most abundant material for manufacturing weapons and cutting tools. Artifacts typically associated with this culture include small stone microblades, microblade cores, bifacial projectile points, and unifacial scraping tools.

In Interior Alaska, this tradition historically included two cultural divisions called the Nenana and Denali complexes. The Nenana Complex was identified by Powers and Hoffecker from sites in the Nenana Valley (Powers and Hoffecker 1989). This complex began approximately 11,000 years ago with an artifact assemblage that included triangular or teardrop-shaped, bifacially worked projectile points (“Chindadn” points [Cook 1969; 1975; Holmes and Cook 1999]); large unifacial chopper-like tools; and flake tools. The Nenana Complex is defined as lacking microblades, microblade cores and burins, and was proposed to predate the microblade-rich Denali Complex. Many Nenana Complex archaeological sites are located in the Tanana Valley, adjacent to FWA training lands (Broken Mammoth [Holmes 1996; Yesner et al. 1999], Chugwater [Lively 1996], Donnelly Ridge [West 1967; 1996, Donnelly Ridge is located in DTA], Healy Lake [Cook 1989], Mead [Holmes 2007] and Swan Point [Holmes et al. 1996; Holmes 1998, 2007]).

The Denali Complex, dated roughly to 10,500 to 8,000 years ago, was originally defined by West (West 1967; 1975) and includes distinctive wedge-shaped microblade cores, core tablets and their derivative microblades, large blades, biconvex bifacial knives, certain end-scrapers, and burins. West later defined the Denali Complex as a regional variant of the American Paleoarctic Tradition (West 1981). Denali sites in the vicinity of FWA’s training lands include Mt. Hayes (West 1996), Swan Point (Holmes et al. 1996; Holmes 1998, 2007), and Gerstle River (Potter 2001). At least one site in TFTA (XMH-2043) has also been dated to this period.

The relationship between the proposed Nenana and Denali complexes is as of yet unresolved. As discussed above, some researchers view the Nenana Complex as a bifacial industry that predates the microblade-based Denali Complex. However, current research at sites such as Swan Point and Broken Mammoth indicates that microblades and burins were used by the earliest known cultures in Interior Alaska, with a later co-occurrence with Chindadn points—the defining artifact type of the Nenana Complex. Although some archaeologists still believe that there is a cultural distinction between the Nenana and Denali complexes (e.g., Dumond 2001), the general understanding from Interior Alaskan archaeologists is that there is a behavioral explanation for the presence or absence of microblades in different assemblages (Holmes 2001; Potter 2008; Yesner and Pearson 2002). Moreover, both Nenana and Denali technology persist in central Alaska throughout the Holocene (Bever 2006).

Site density declined in the areas around FWA in the early Holocene, suggesting a slight depopulation during a period of climate change which initiated the widespread establishment of spruce forests (Potter 2008). The boreal forest in Interior Alaska was established by 8,000 years ago (Bigelow and Powers 2001). Sites from this time period are less well publicized than the older sites, but include Houdini Creek (circa 8,600 years old), Hurricane Bluff (c. 9,800 years

old), Lucky Strike (c. 8,500 years old), Gerstle River (c. 10,000 years old), and the Campus Site (c. 7,700 years old) (Pearson and Powers 2001; Potter et al. 2007; Potter 2008). Bison, wapiti, and birds were the most important subsistence game during this period (Potter 2007, 2008).

Site density increased again after about 6,000 years ago in Interior Alaska (Potter 2008). This population increase coincides roughly with the Northern Archaic Tradition and the appearance of side-notched projectile points. Anderson originally defined the Northern Archaic Tradition to specifically address notched point-bearing stratigraphic horizons that did not contain microblades at the Onion Portage site in northern Alaska (Anderson 1968). Alaskan notched points were generally similar to Archaic-age dart points in the contiguous United States. Time has shown middle Holocene assemblages in Alaska to be quite diverse, however, and it is questionable whether this trait is related to southern forms or if it is a reliable indicator of cultural affiliation (Clark 1992; Cook and Gillespie 1986). Artifact assemblages associated with this culture can vary but generally contain myriad tools ranging from bifacial knives and microblades to end scrapers and side-notched points. Middle Holocene hunter-gatherers had a subsistence economy focused on seasonally abundant game including caribou, fish, and moose (Potter 2008). Notched point assemblages occur in many sites in Interior Alaska including over one dozen on Army lands (XBD-277, XMH-277, XMH-283, XMH-303, XMH-309, XMH-874, XMH-950, XMH-1130, XMH-1168, XMH-1300, Robertson et al. 2004, Raymond-Yakoubian and Robertson 2005.) Several sites (XBD-270, XMH-915, XMH-925), including the excavated Banjo Lake site in DTA (XMH-874), have also produced middle Holocene dates from hearth charcoal. The 6,300-6,700-year-old dates from Banjo Lake were also associated with a microblade component (Robertson et al. 2008).

Utilization of microblade and burin-based industries appears to continue through the middle and late Holocene in Interior Alaska (Esdale 2008; Potter 2004). By the late Holocene, archaeologists see a shift from seasonal large mammal hunting with a nomadic lifestyle to a focus on seasonally over-abundant resources, use of storage, and more permanent settlements (Potter 2008b). Artifact assemblages do not drastically change until the last millennium of the Holocene when microblades disappear from the archaeological record (Potter 2008).

Linguistic evidence suggests that the Athabaskan culture may have appeared in the Tanana Valley as early as 2,500 years ago. Through ethnography, oral history, and a broad array of cultural items, much has been learned about Athabaskan culture and history in the region. Artifacts associated with the Athabaskan culture are exceptionally diverse and include bone and antler projectile points, fishhooks, beads, buttons, birch bark trays, and bone gaming pieces. In the Upper Tanana region, copper was available and used in addition to the traditional material types to manufacture tools such as knives, projectile points, awls, ornaments, and axes (Clark 1981). A late prehistoric Athabaskan occupation is recognized at several sites in and around FWA's training lands (Andrews 1975; Andrews 1987; Cook 1989; Mishler 1986; Sheppard et al. 1991; Shinkwin 1979; Yarborough 1978). Of particular interest in this regard is a copper projectile point recently found in a buried context at DTA (XBD-272) (Robertson et al. 2009).

The Athabaskan Tradition includes late prehistoric and proto-historic cultures generally believed to be the ancestors of Athabaskan tribes who currently inhabit Interior Alaska. Excavated Athabaskan sites are rare, but the limited body of evidence allows for several generalizations.

Raw material usage was reorganized in the Athabaskan Tradition, which de-emphasized stone tool making and increased the emphasis on the manufacture of items from native copper and organic materials (Dixon 1985). Assemblages include ground and pecked stone artifacts and an increased use of expedient tools. There was a broadening and diversifying of the resource base at this time to include small mammal and freshwater marine animals such as fish and mollusks (McFadyen Clark 1981; McFadyen Clark 1996; Ream 1986; Sheppard et al. 1991; Shinkwin 1979). Athabaskan sites tend to occur in resource-rich areas near lakes, streams and rivers, and are generally characterized by large house pit and cache pit features. Proto-historic Athabaskan assemblages include Euro-American trade goods such as glass beads and iron implements. Sites of this time period reflect an increased reliance on outside trade and include log cabins co-occurring with traditional house pits, as well as a change in site location to maximize trading opportunities (Andrews 1975; Andrews 1977; Andrews 1987; McFadyen Clark 1981; VanStone and Goddard 1981).

Athabaskan settlement patterns depended greatly on the availability of subsistence resources, and Interior bands lived a nomadic lifestyle. They often traversed vast areas to support themselves and spent considerable time engaged in subsistence activities. It was often necessary for bands to divide into smaller groups to find game, and preserved fish were used as a staple of the diet in addition to fresh game (Andrews 1975).

Four Athabaskan linguistic and geographic groups have inhabited the Tanana Valley: the Upper Tanana, Tanacross, Tanana and Koyukon. Each group is further distinguished according to geographic location. Bands of the Tanana and Tanacross groups are historically associated with the geographic area that embodies Forts Wainwright and Greely. Salcha, Chena, Wood River, Goodpaster, and Healy Lake bands have inhabited the region since protohistoric times and possibly even prehistoric times (Andrews 1975). Use of the region varied from one band to the next. The Salcha, Chena, Goodpaster, and Wood River bands of the Tanana Athabascans and the Healy Lake band of the Tanacross Athabascans used certain parts of what are now Forts Wainwright and Greely (McKenna 1981). Several villages have been reported on or near FWA. One occupied by the Wood River band is said to have been located in the southern part of FWA but has not been found (Dixon 1980; Reynolds 1986). The Blair Lakes Archaeological District (FAI-335) on FWA may relate to the prehistory of the Athabaskan Tradition. Euro-American historic archaeological sites are also present (Gamza 1995; Phillips 1984).

1.4 Historic Context

1.4.1 Early History

With the beginning of Euro-American contact in Interior Alaska in the early 19th century, trade influences and influxes of new populations began to change life in the region. Land use patterns shifted from traditional indigenous uses to activities based on Euro-American economic and political systems. FWA's training lands fall within an area occupied at the time of Euro-American contact by Lower-Middle Tanana Athabascans, including bands described generally as the Salcha, Big Delta-Goodpaster, Wood River, and Chena bands (McKenna 1981; Andrews 1975; Mishler 1986). Historical accounts document traditional settlement patterns that were focused on a widely mobile seasonal round, with the fall caribou hunt playing a pivotal role in subsistence preparations for the winter, and summer activities focused at fish camps, berry and

root collecting and in sheep hunting. These activities were frequently communal, with several local bands connected by common interest, geography and intermarriage. Despite anthropological attempts to define boundaries for the peoples living in the lower Tanana River Valley, natural terrain served as the only definable boundary to settlement patterns (McKenna 1981).

As Euro-American traders, miners, missionaries and explorers moved into the Tanana River Valley, the traditional life ways of local Athabascan groups were disrupted. Access to trade goods and the development of the fur trade not only affected traditional material culture, but also began to dramatically affect subsistence activities and settlement patterns. Similarly, the arrival of missionaries in the Alaskan Interior profoundly influenced traditional social organization. The introduction of mission schools for Native children and the doctrine of new religious beliefs contributed to an erosion of traditional practices (McKenna 1981).

Russian fur traders began settling Interior Alaska starting in the 1810s, establishing a post at Nulato on the Yukon River and one at Taral on the Copper River. British traders established Fort Yukon in 1847. Trade goods from these posts may have passed to Tanana Athabascans and Upper Tanana Athabascans through intra-Native trade networks. Direct contact between Tanana Athabascans and white traders increased after the 1860s. With the U.S. purchase of Alaska in 1867, control of trading stations and the fur trade passed to Americans. Through the 1880s, American traders established several additional posts on the Yukon and Tanana rivers, including locations at Nuklukayet (modern-day Tanana), Belle Isle (modern-day Eagle), and Fort Yukon.

Trade goods introduced by Euro-American settlers influenced the Native lifestyle. Clothing, staples, tools, and other necessities could be obtained through trade. Guns allowed hunters to obtain game with greater efficiency. Gradually, Athabascan Native groups began to alter their traditional nomadic patterns in favor of more permanent settlements. However, while significant, this contact would not have as dramatic an impact on the region as the discovery of gold in the Interior during the last decades of the 19th century. The towns established by Euro-American settlers at the turn of the 20th century, in response to the Klondike Gold Rush and the eventual military development of the region, would rapidly and permanently change the demography and economy of Interior Alaska.

Gold strikes in the Fortymile River region, Birch Creek area, and the Canadian Klondike began drawing miners and prospectors north in the 1880s and 1890s. In response to this gold rush, E.T. Barnette established a trading post on the Chena River in 1901. The following year, prospector Felix Pedro discovered gold nearby, and a new gold rush soon led to the founding of Fairbanks at the site of Barnette's original trading post. Most mining activities in the region occurred on creeks north of Fairbanks, with the town serving as a supply center. Agricultural and other commercial activities, such as lumber, also developed to support mining activities in the Fairbanks area. Homesteads existed on parts of what is today the Main Post of FWA as early as 1904.

In 1898, the discovery of gold in the Tanana uplands began a rush of Euro-American settlement into the Tanana River Valley. As the economic importance of the Tanana Valley increased, the need for reliable transportation routes and communication systems rose in tandem. Existing

trails, such as the Bonnifield, Donnelly-Washburn and Valdez-Fairbanks trails, saw increased use and development in the first decade of the 20th century. This increase in activity also resulted in the establishment of several roadhouses and posts. In 1906, Congressional appropriations led to improvement of the Valdez-Fairbanks Trail, crossing the Alaska Range south of Delta Junction, following the Tanana River to Fairbanks. Completion of the Alaska Railroad in 1923 was followed two decades later by construction of the Alaska Highway in 1942, firmly tying the Alaskan Interior to the outside.

As Fairbanks grew in the first decade of the 20th century, several agricultural homesteads were developed on lands now encompassed by sections of the FWA cantonment. These homesteads provided Fairbanks with a variety of agricultural products and wood for fuel, but were subsumed when lands were withdrawn for the creation of Ladd Field, which later became FWA (Price 2002).

Riverboats were the primary means of getting people and supplies into the Interior at the turn of the 20th century. The Fairbanks town site was located at the upper limit of navigation for stern-wheeler riverboats on the Chena River. Upriver from that point, residents navigated the river using shallow-draft boats in summer and sleds in the winter. As commerce in the area increased, roads and trails were constructed, sometimes following earlier indigenous routes. The major overland route to tidewater was the Valdez-Fairbanks Trail, which began as a military trail from Valdez to Eagle in 1899.

Transportation and communication networks, including the Alaska Railroad, were developed to serve new settlements in Interior Alaska. A branch of the railroad route was extended to Fairbanks in 1904. Roadhouses along the route catered to travelers. Some of these roadhouses were located out on what are now FWA training lands. One property was on the Bonnifield Trail in the Tanana Flats Training Area while two roadhouses and a seasonal tent operation existed along the Donnelly-Washburn Trail in the current Donnelly Training Area. Secondary routes connected Fairbanks to the surrounding mining districts.

By 1910, most of the easily accessible placer gold deposits were exhausted, and capital-intensive technologies became necessary to extract remaining deposits. These methods were not possible with the existing transportation infrastructure. The completion of the Alaska Railroad in 1923 expanded transportation options for the region, connecting Fairbanks to the tidewater at Seward and making large-scale dredging operations economically feasible. Aviation also became a key component of Interior transportation, beginning in earnest in the 1920s. However, it was not until 1931 that Weeks Field, originally constructed in 1923, was officially dedicated as an airfield. Industrialized corporate activity became the hallmark of the region's mining in the remaining years before World War II.

Development in the Alaskan Interior increased dramatically with the advent of World War II and subsequent military build-up in Alaska. Of particular significance was the development of airfields near Delta Junction (Fort Greely), Fairbanks (Ladd Field, later FWA), and 26 miles southeast of Fairbanks (Eielson Air Force Base). These locations began as Lend-Lease bases and cold weather testing centers, but soon expanded with the increased need for military support during World War II and later during the Cold War.

Full historic contexts of early mining, transportation, and homesteads on FWA have been completed. These studies have determined that there are no properties eligible for the National Register under these contexts. Several village sites associated with the early contact period have been reported near FWA. One was reported near Wood River Buttes, two just northwest of the installation's boundary, and one near Fairbanks (Reynolds 1986). None have been reported or located on the Main Post.

1.4.2 Ladd Field National Historic Landmark

In 1935 Ladd Field was authorized as a small cold weather testing station that was envisioned by General H. H. Arnold. Construction began in 1939, and by 1940 Ladd Field was operational.

Cold weather testing at Ladd Field helped to improve the aircraft and equipment used by front-line aircrews. The Cold Weather Test Detachment's experimental tests contributed to the development of aircraft design, ground procedures and personnel equipment with stateside research agencies and manufacturers. After the start of World War II, Ladd Field also served as the transfer point for the Alaska Siberia (ALSIB) Lend-Lease aid to the Soviet Union. From 1942 to the end of the war in 1945, Ladd Field saw 7,926 aircraft and associated cargo change hands. Though it was controversial, the Lend-Lease aid to the Soviet Union played some part in the eventual defeat of Nazi Germany. Ladd Field also served as an air depot for the repair and supply of aircraft under the Air Transport Command, processing thousands of passengers as well as tons of cargo and mail.

In 1984, Ladd Field was listed on the National Register of Historic Places. Ladd Field was listed as significant for three main themes: 1) cold weather testing, 2) aircraft repair, supply depot and air transfer hub and 3) as the transfer point for aircraft and cargo transiting the ALSIB route to the Soviet Union.

1.4.3 Ladd Air Force Base Cold War Historic District

In 1947, the Air Force became a separate service, and Ladd Field became known as Ladd Air Force Base (AFB). Missions flown out of Ladd AFB played a significant role in the early years of the Cold War confrontation with the Soviet Union. Early in the Cold War, military planners decided on a heartland concept for Alaskan defense, concentrating on bases near Anchorage and Fairbanks as the strategic anchor points. Ladd AFB became the Northern Sector Headquarters for the Alaskan Air Command, and its foremost missions during the Cold War were air defense, strategic reconnaissance and arctic research.

Ladd AFB's air defense mission was part of the plan to deter the Soviet Union from taking Alaskan territory and using it as a base from which to threaten the continental United States. Ladd AFB hosted tactical fighter intercept squadrons and combat alert cells. An Air Defense Command Center located on Ladd AFB was responsible for directing air battles in Alaska's northern sector. It also provided support to segments of the Distant Early Warning Line. In the earliest years of the Cold War, Ladd AFB hosted some of the first long-range strategic aerial reconnaissance units.

Ladd AFB was also the scene of significant Cold War arctic research. The cold weather equipment testing, begun during World War II, continued through the Cold War and expanded to

include the Arctic Aero medical Laboratory (AAL). The AAL studied human adaptation to Arctic and Sub-Arctic climates with an eye toward military applications.

In 2001, the Ladd AFB Cold War Historic District was determined eligible for the National Register of Historic Places. It was determined to be significant for its role in the early Cold War missions of the 46th/72nd Air Reconnaissance unit and for the fighter intercept squadrons stationed here.

1.4.4 Fort Wainwright

In 1960, Ladd AFB was transferred to the Army and was renamed Fort Jonathan Wainwright on January 1, 1961. In Alaska, Cold War missions were predominately under the command of the Air Force with the Army providing ground force defense and logistical supply. The Army also carried out cold weather training tactics and cold weather equipment testing. The onset of the Vietnam War and its high costs drained the Army's resources; troops at Wainwright were reassigned or deployed, causing a significant decrease in the post's population. In 1986, the mission of the post changed once again with the assignment of the 6th Light Infantry Division to FWA. Since 1986, FWA's mission has been to support worldwide deployment.

2.0 FWA CANTONMENT AND ADJACENT TRAINING AREAS

2.1 Introduction

The FWA cantonment and adjacent training areas (Figure 2) consists of approximately 15,500 acres east of Fairbanks on the floodplain of the Chena River. The Main Post lies within the Tanana-Kuskokwim lowland. This depression was subsiding as the Alaska Range was rising to the south and filling with sediments from those mountains. The area is bounded by uplands to the north, the Alaska Range to the south, and consists of alluvial fans extending northward from the mountains. The Tanana River flows along the northern edge of the lowland. The terrain is generally flat lowland, ranging from 128 to 512 feet above sea level (Nakata Planning Group 1987). Bedrock is primarily composed of Precambrian Birch Creek schist, with few areas of granite and quartz diorite. The cantonment is covered by alluvial sediments and a thick mantle of micaceous aeolian silt (loess) derived from outwash plains south of the Tanana River (Muhs and Budahn 2006). Soils are typically well-drained, brown silt loam associated with poorly-drained silt loams in depressions and drainages (Natural Cooperative Soil Survey 1999).

Fort Wainwright has four vegetation types: moist tundra, treeless bogs, open low-growing spruce forests, and closed spruce-hardwood forests. The white spruce-paper birch forest of Interior Alaska is often called the boreal forest or taiga. Vegetation types of Interior Alaska form a mosaic and reflect fire history, slope and aspect, and presence or absence of permafrost (Viereck and Little 1972). Forests are dominant, diverse ecosystems on cantonment and adjacent training lands. Vegetation ranges from pure stands of spruce or hardwoods to spruce/hardwood mixtures.

2.2 Cantonment Surveys

All surveys in the FWA cantonment during the 2010 field season were associated with Army undertakings. In 2011, an effort was made to complete systematic surveys of all previously unsurveyed areas of the cantonment, north and south of the Chena River. Portions of the Small

Arms Complex south of the Richardson Highway (see Figure 2) were also surveyed in 2010. Large parts of the complex are off-limits to archaeologists due to danger from unexploded ordinances.

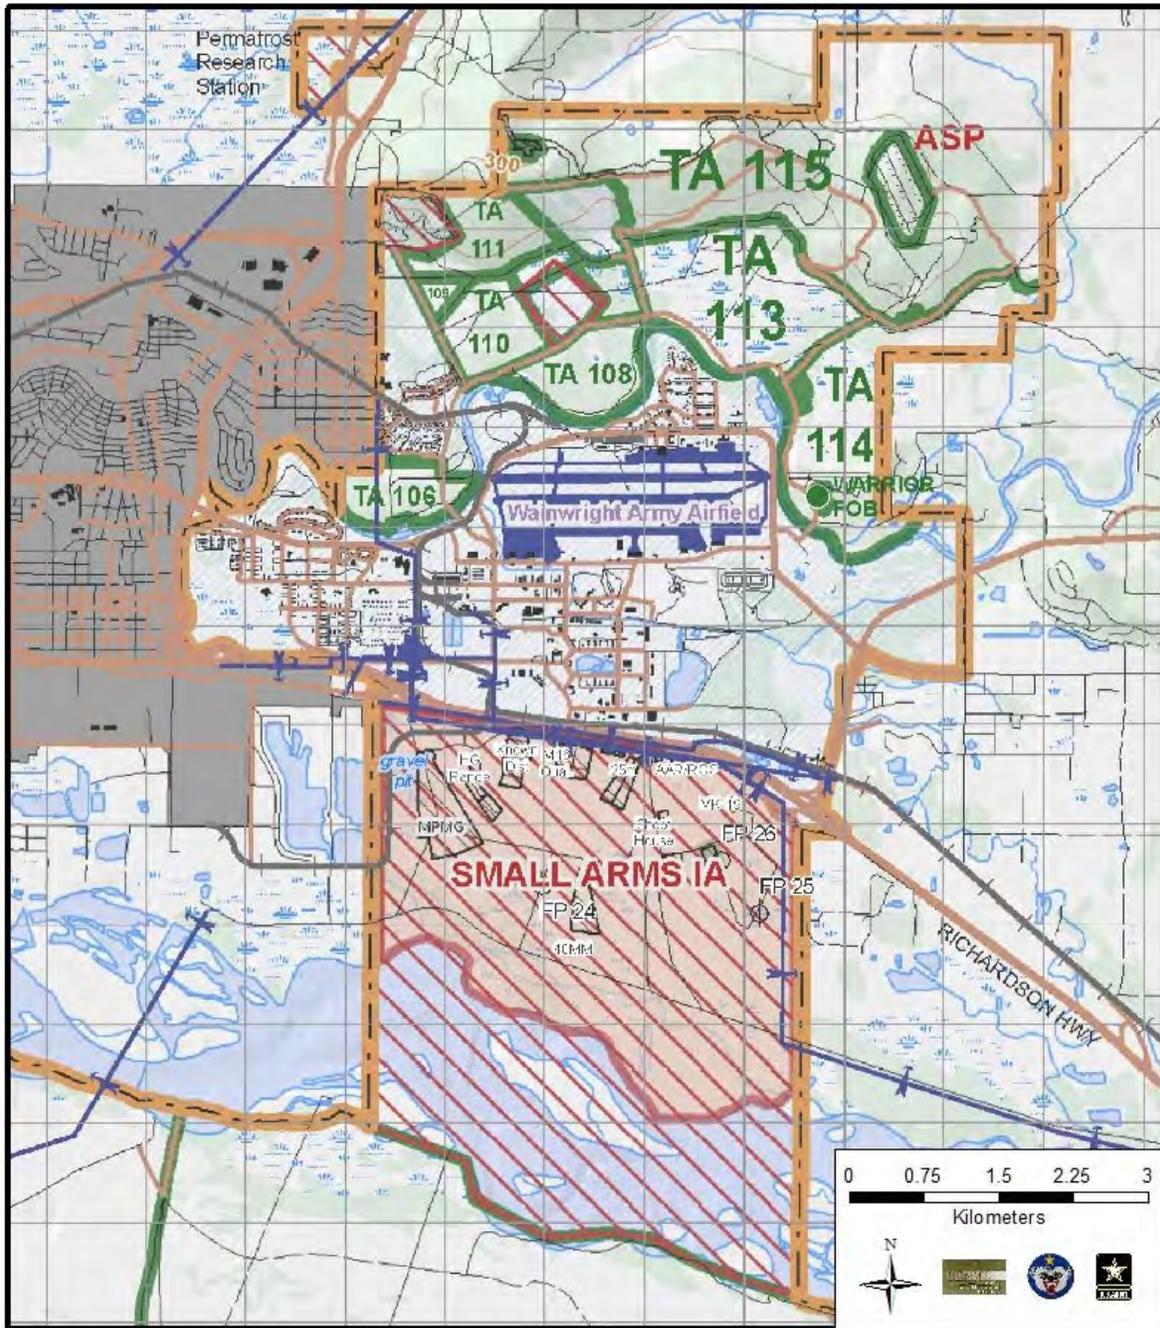

Figure 2. FWA cantonment

In 2010, the Small Arms Complex (red in Figure 2) was the concentration of an archaeological survey both as a part of two small undertakings (previously reported to the SHPO) and for Section 110 inventory. Much of the Small Arms Complex is restricted due to the possible

presence of duded impacts, and several areas are considered disturbed (Figure 3). The portions of the Small Arms Complex surveyed in 2010 (425 acres) are shown in Figure 4. Section 106 surveys on the cantonment included the golf course clubhouse area and Chena Bend bike trails (SHPO letter 9/10/10) (included in 2010 survey layer, Figure 4)³.

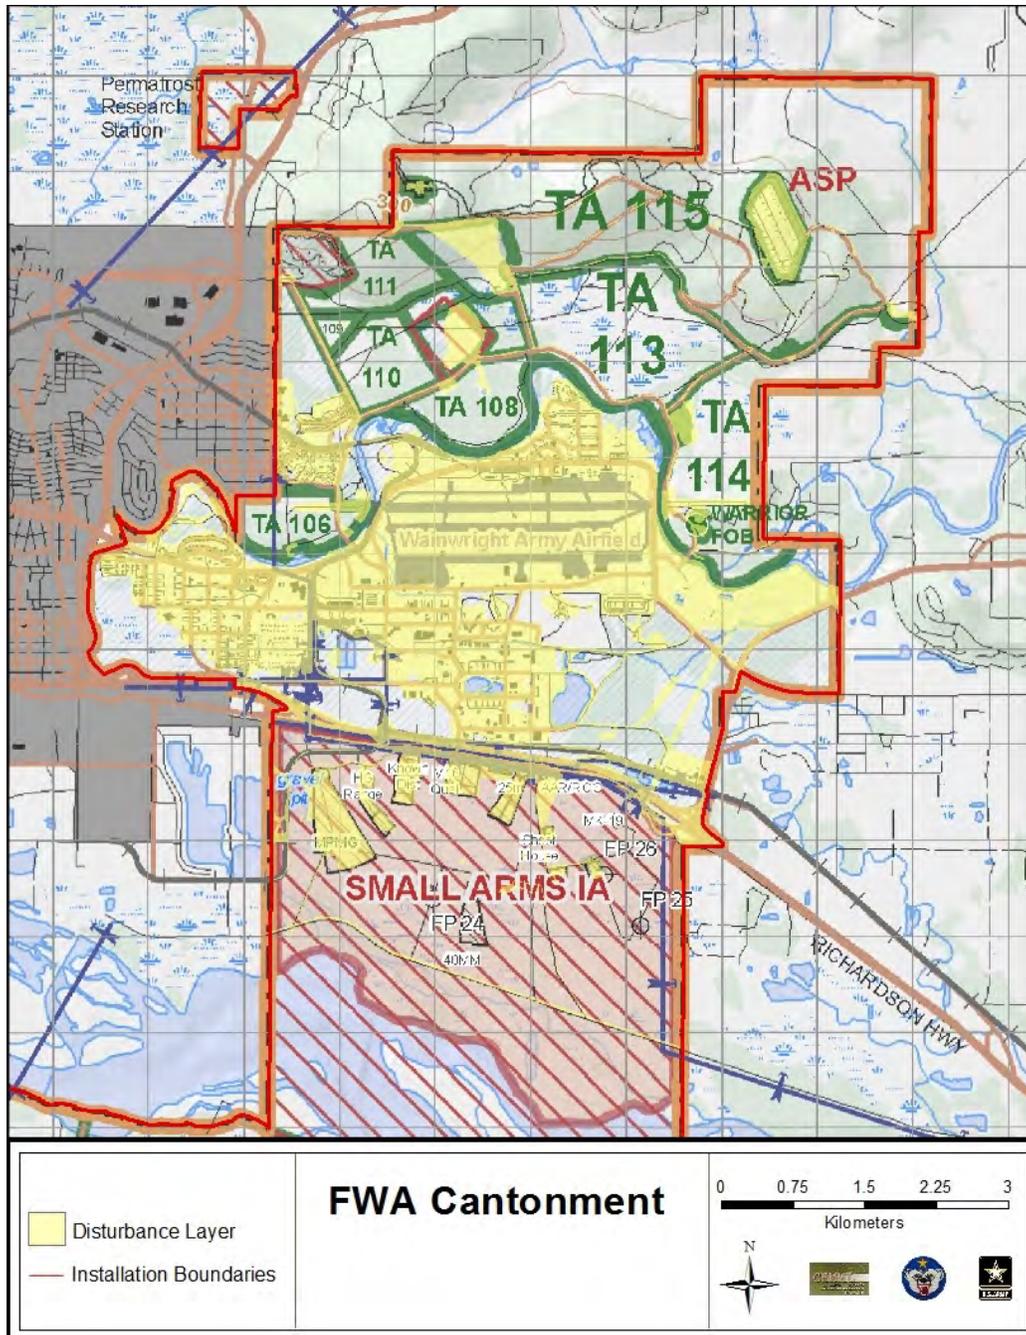

Figure 3. Cantonment disturbance layer

³ All section 106 activities for 2010 and 2011 are listed in Appendix 4.

In 2011, much of the cantonment north and south of the Chena River (5955 acres, Figure 4) was surveyed for Section 110 inventory. That total includes surveys of Birch Hill (1170 acres) and TA 108 (196 acres) for Section 106 projects already reported in letters to the SHPO (SHPO letter 8/30/11).

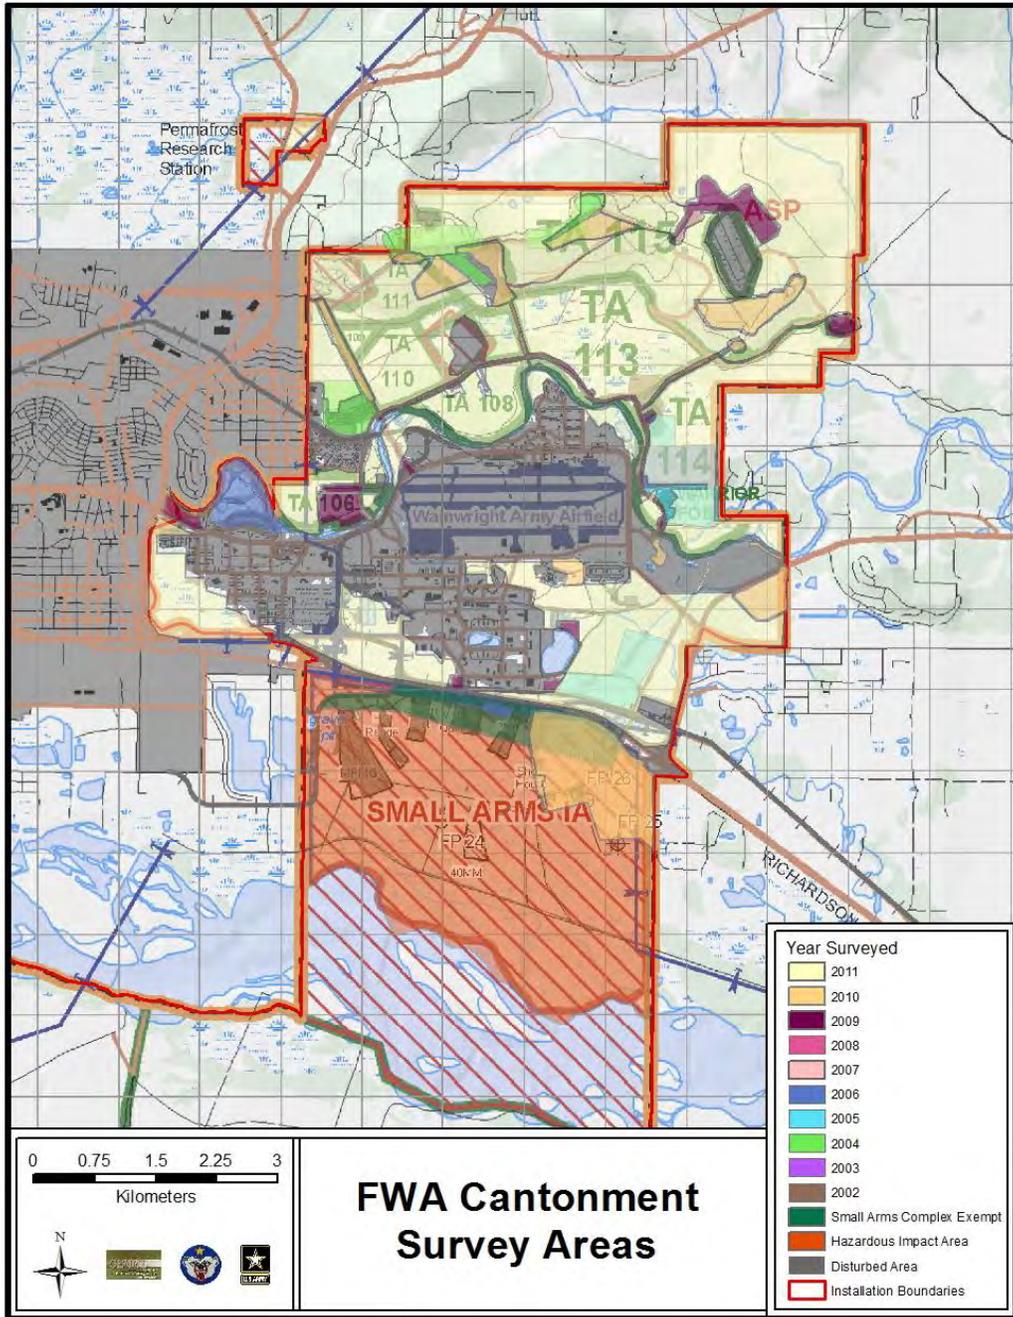

Figure 4. Cantonment surveys by year

2.3 Cantonment Sites

Only 11 archaeological sites are known from the cantonment area (Table 1, Figure 5). Two have been determined ineligible by the SHPO and CEMML. Determinations of Eligibility (DOE) are planned for the remaining nine sites during the 2012 field season.

Table 1. Archaeological sites in the FWA cantonment

2.3.1 2011 Archaeological Sites

FAI-02117 (*From previous 106 letter- SHPO concurrence 8/30/11*)

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

FAI-02117 is located on the FWA cantonment, in Training Area 108, just north of the Chena [REDACTED] (Figure 6). This site consisted of three different features related to the military or homestead-era history of FWA. Feature 1 is a rectangular depression measuring 220 cm long x 110 cm wide x 40 cm deep (Figure 7). Feature 2 is a sled or other device made from wood, metal, springs, leather cords, and round nails. The feature consists of a rectangular box (250 cm long x 61 cm wide x 28 cm deep) made from 2" and 1 5/8" thick boards (Figure 8). A metal foot-powered steering device is located at one end of the sled. At the opposite end, a curved wood handle is tied onto the frame with leather lashing. The third feature is a closed box structure with a hinged wood door (Figure 9). The box is 135 cm long x 84 cm wide x 82 cm deep. An old fuel can is mounted inside the structure and a stove-pipe with metal flashing was found on top of the box.

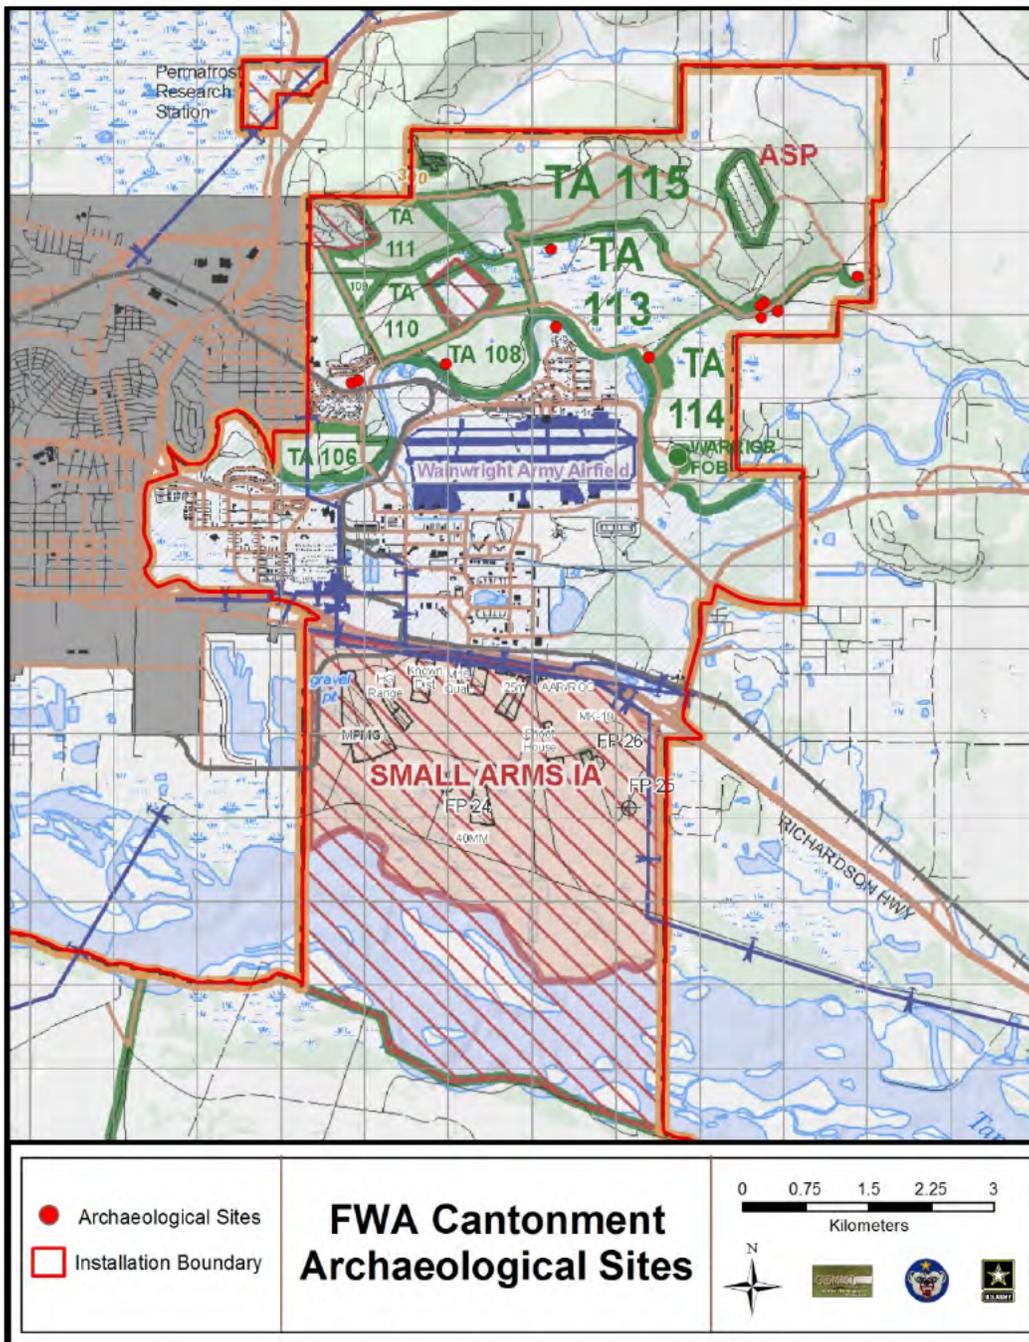

Figure 5. Cantonment archaeological site locations

3.0 YUKON TRAINING AREA (YTA)

3.1 Introduction

FWA's YTA (Figure 10) consists of nearly 250,000 acres within the western portion of the Yukon-Tanana Uplands section of the Northern Plateau physiographic province of Interior Alaska (Wahrhaftig 1965). This area is characterized by round, even-topped, north-east to east trending ridges that rise roughly 150 to 450 m above adjacent valley floors to an elevation of 450-915 masl (meters above sea level). Bedrock is primarily composed of Precambrian Birch Creek schist, with few areas of granite and quartz diorite. Most of YTA is covered by a thin (1-200 cm) mantle of micaceous aeolian silt (loess) derived from outwash plains south of the Tanana River (Muhs and Budahn 2006). Soils are typically well-drained brown silt loam associated with poorly-drained silt loams in depressions and drainages (Natural Cooperative Soil Survey 1999).

YTA has four vegetation types: moist tundra, treeless bogs, open low-growing spruce forests, and closed spruce-hardwood forests. The white spruce-paper birch forest of Interior Alaska is often called the boreal forest or taiga. Vegetation types of Interior Alaska form a mosaic and reflect fire history, slope and aspect, and presence or absence of permafrost (Vioreck and Little 1972). Forests are dominant diverse ecosystems on YTA. Vegetation ranges from pure stands of spruce or hardwoods to spruce/hardwood mixtures.

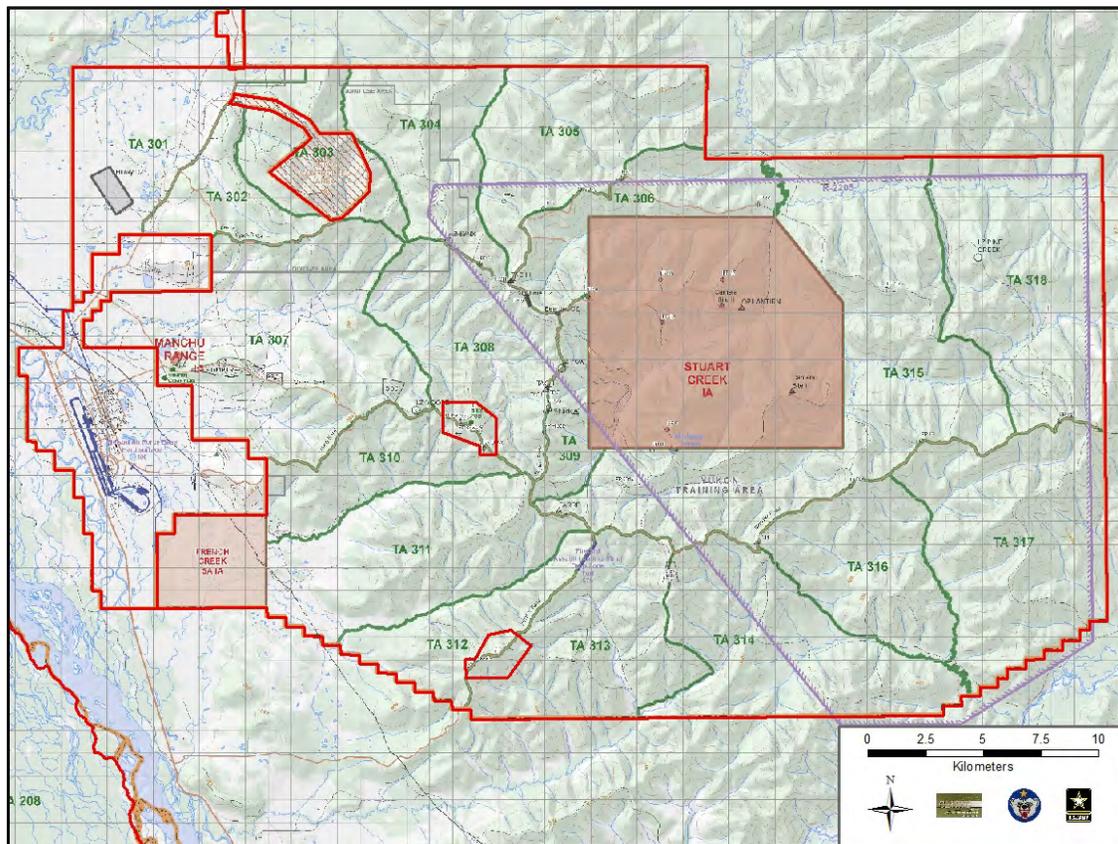

Figure 10. YTA

3.2 YTA Surveys

Archaeological surveys in YTA have generally been guided by Section 106 undertakings. Road and trail maintenance and expansion and the development of timber sales areas were the most common projects in 2010 and 2011. FWA's Range Control has developed areas of potential future development (called PDZs— potential development zones) that have also been surveyed for archaeological resources in advance of any actual undertakings (Figure 11). During the 2010 and 2011 field seasons, survey was completed on four PDZs. Pedestrian surveys at 20 m intervals covered 70 acres of the Johnson Road PDZ, 134 acres of the Grizzly High PDZ, 595 acres of Brigadier Road, and 74 acres of the Skyline Road PDZ. Skyline Road and 20 m on either side of the road has been surveyed in its entirety (Figure 12). In addition, 1 km blocks to the east of Skyline Road were completed in 2006 (Figure 12). Much of Brigadier Road had been previously surveyed, but the firing points and higher potential areas along the road bed were re-examined in 2010. Complete survey coverage of PDZs will help to streamline future military activities in these areas.

The next survey efforts for PDZs will take place during the 2012 field season. Much of the Transmitter Road area is scheduled for survey (Figure 11) and DOEs are planned for all archaeological sites adjacent to the road beds or firing points in YTA (Figure 13).

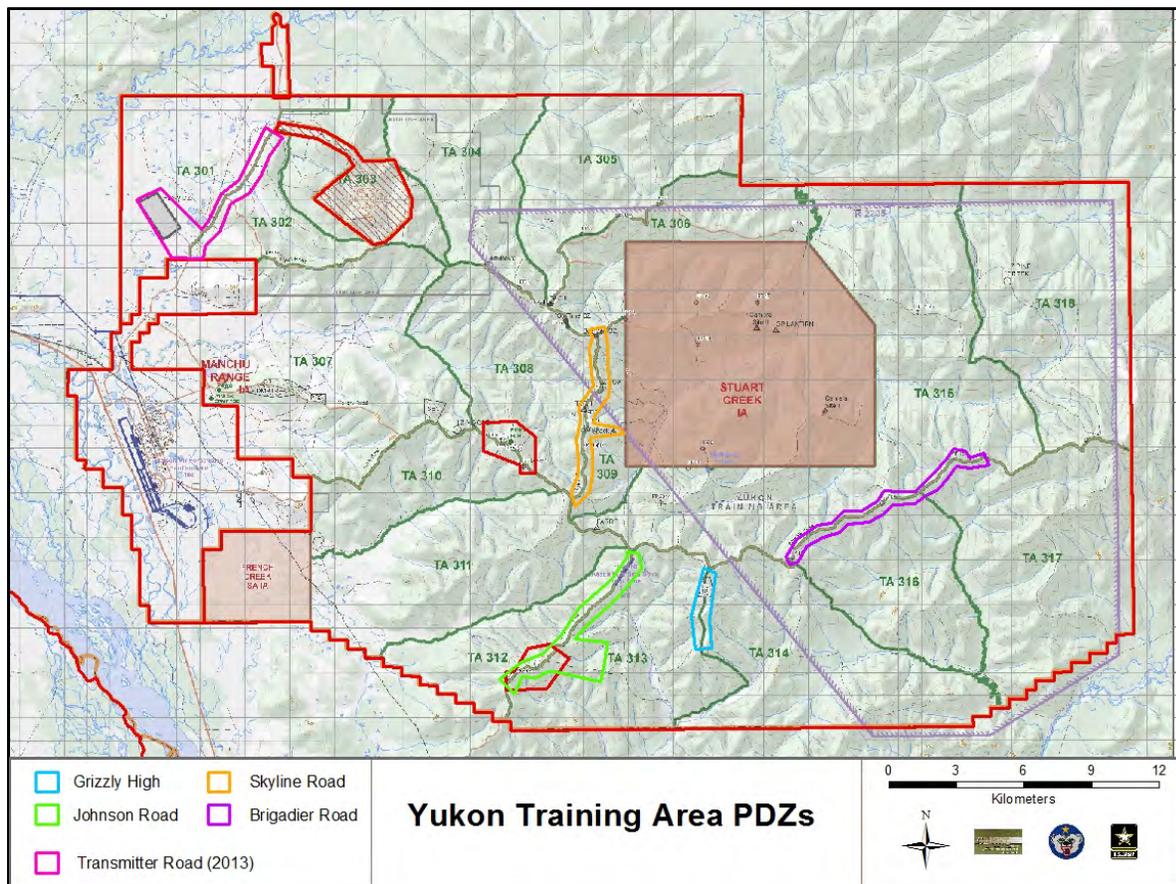

Figure 11. YTA potential development zones

Survey areas for Section 106 undertakings in 2010 and 2011 included North Beaver Creek Road (SHPO letter 5/3/11), Beaver Creek Road to LZ Lynx (SHPO letter 11/2/11), McMahon Trench and Firing Point 2014 (SHPO letter 1/14/10), the borrow pit area at the intersection of Quarry and Skyline roads (SHPO letter 8/30/11), and timber sales areas along Quarry Road, Johnson Road, and Transmitter Road (SHPO letters 8/30/11 and 11/2/11).

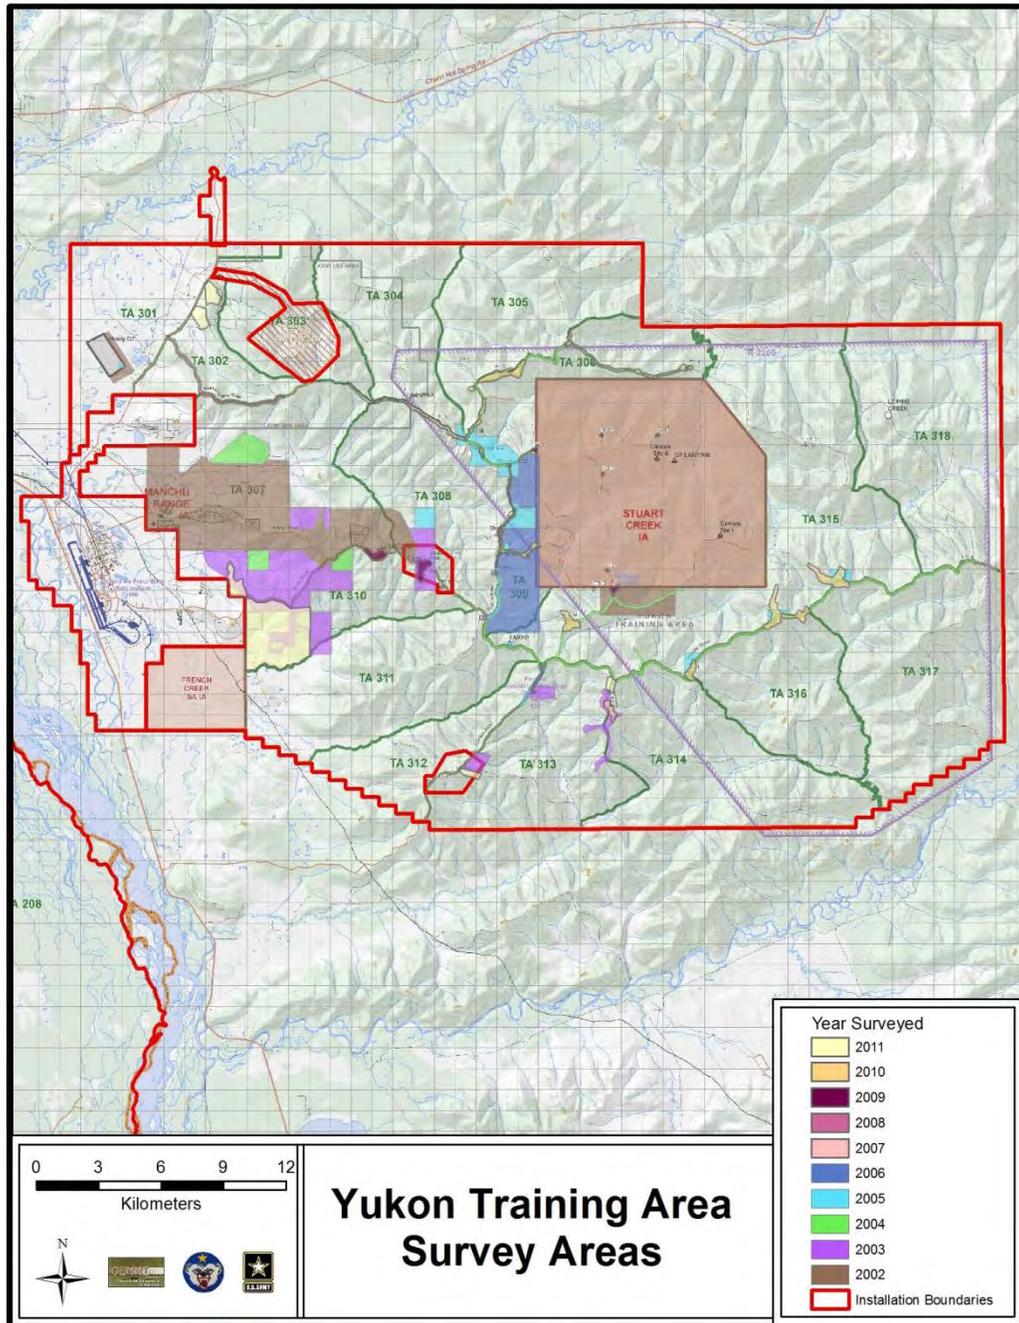

Figure 12. YTA survey areas by year

3.3 YTA Sites

Twenty archaeological sites are known from YTA (Table 2, Figure 13). The vast majority (19) are prehistoric lithic scatters. Ten of these sites have been determined ineligible for the NRHP and the other 10 have yet to be evaluated. Four of these sites were discovered during the 2010 and 2011 field seasons. During the summer of 2010, CEMML archaeologists discovered three sites (XBD-00368, XBD-00369, and XBD-00370) in the North Beaver Creek Road area of YTA (Figure 13). XBD-00368 and XBD-00369 are likely collapsed rockshelter sites that add to the growing body of evidence of this site type in YTA and the surrounding Yukon-Tanana upland (Figure 14). In 2010, one additional site was found at Firing Point Lynx on West Beaver Creek Road (XBD000369). XBD-00369 is an open-air site with lithic debitage buried in an intact stratigraphic sequence.

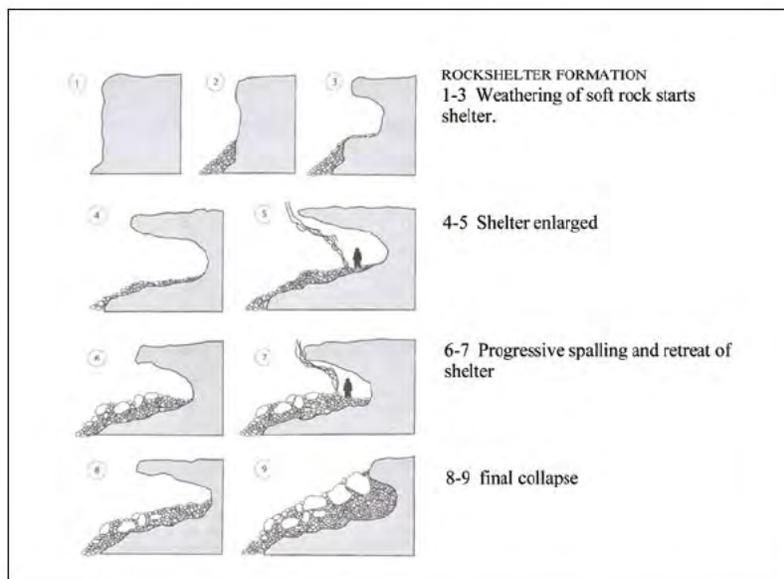

Figure 14. Geologic evolution of rockshelters

3.3.1 2010 Archaeological Sites

XBD-00368 (*From previous 106 letter- SHPO concurrence 5/3/11*)

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XBD-00368 is located near the southern base of a large hill on the north side of North Beaver Creek Road, at UTM coordinates [REDACTED] (Figure 15, 16). Site elevation is 663 masl. The general site area is approximately two meters above North Beaver Creek Road (Figure 17). The site boundaries are fairly restricted by an abandoned two-track 2-3 m northeast of the site, push piles 3-5 m west and southwest of the site, and North Beaver Creek Road, 4 m south of the site datum. North of the site, the terrain begins to climb at a 20-30° slope to the crest of the hill, approximately 50 m above the site. South of North Beaver Creek Road, the terrain drops sharply (25-35°) to the valley below. The nearest water source is a branch of Moose Creek, approximately 2.5 km south of the site. A branch of Hunts Creek is located approximately 2.5 km north of the site. The location is south-facing with a limited viewshed due to topography and vegetation.

The ecosystem is characterized by upland moist mixed needleleaf/broadleaf forest. Site vegetation includes spruce, birch, aspen, alder, willow, low scrub, mosses, and lichen. Surface exposure was generally 0-5%, higher in disturbed areas (push piles, etc.) in the vicinity.

The site is situated at the base a schist/quartz rock outcrop that rises approximately two meters above the surrounding ground surface (Figure 17). It is possible, if not likely, that the site represents the remains of a collapsed rockshelter that evolved in a scenario similar to that illustrated in Figure 14.

Site XBD-00368 was identified through subsurface testing. Cultural material was recovered from one of two test pits, which yielded a single dark gray (5Y 4/1) chert broken flake (UA2010-239), size class 10-20 mm at 25-35 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silts containing a high concentration of schist pebbles, gravels, cobbles, and flagstones, at least 50 cm thick, overlying decomposing schist bedrock extending to at least 80 cm BS (Figure 18, Figure 19).

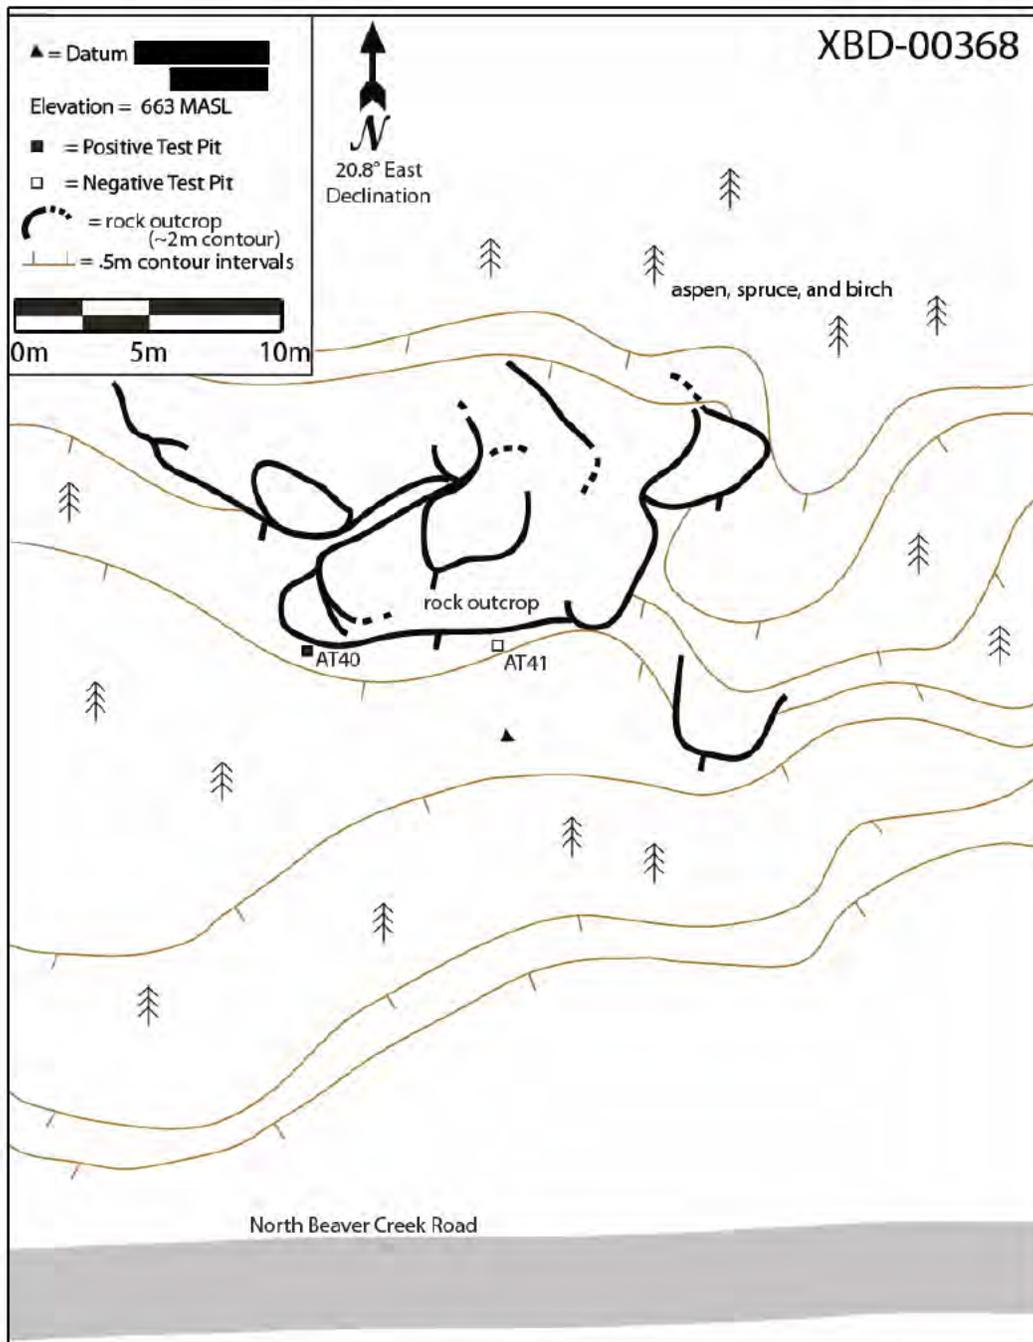

Figure 15. XBD-00368 sketch map

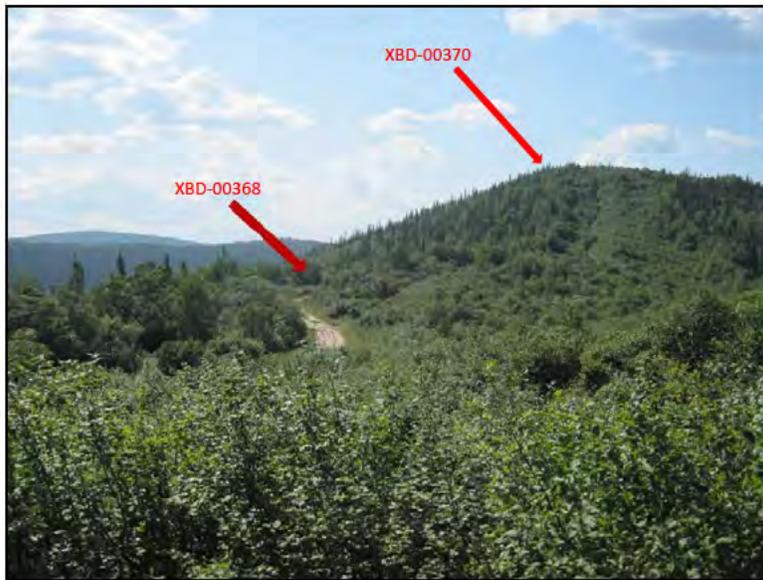

Figure 16. XBD-00368 overview (view to southwest)

Figure 17. XBD-00368 overview (view to north)

Figure 18. XBD-00368 test pit stratigraphy

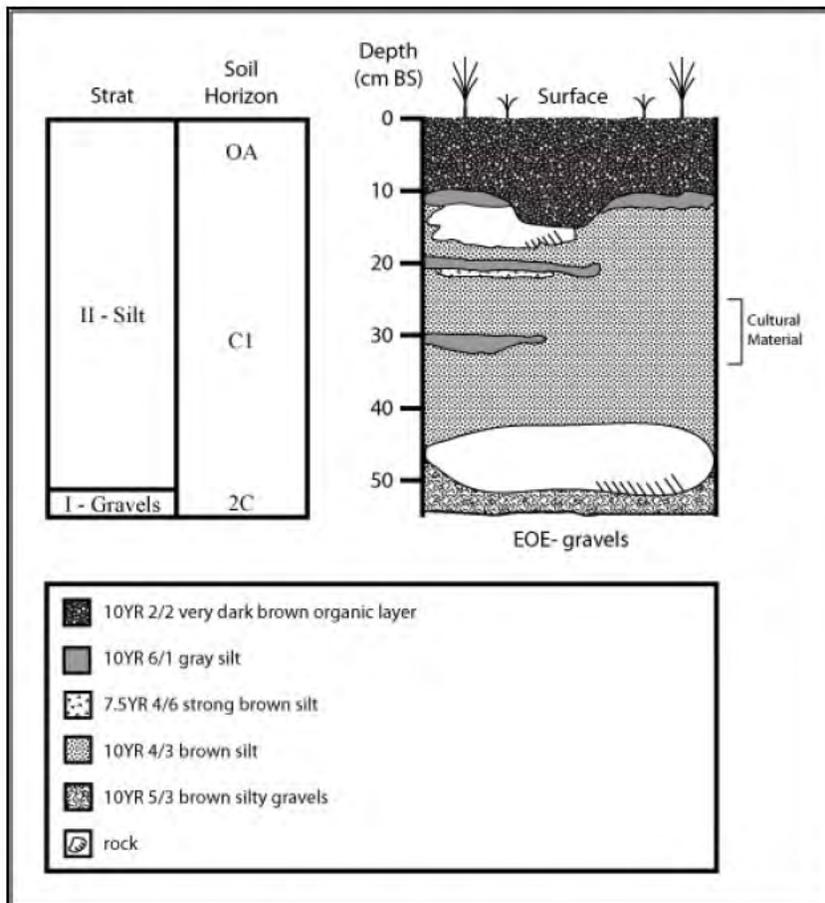

Figure 19. XBD-00368 stratigraphy

XBD-00369**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site XBD-00369 is located on the southern slope of Brigadier Road North in YTA. UTM coordinates are [REDACTED]. Site elevation is 755 masl. The site is situated on a narrow knoll, which has steep (25°) slopes to the south and west and remains fairly level (8-10°) to the north and east (Figure 20, Figure 21). Brigadier Road is approximately 150 m to the north of XBD-00369. The site is estimated at approximately 20 m east–west and 10 m north–south. The nearest water source is an unnamed drainage creek 1 km to the west, which is not visible from the site.

The location would offer approximately a 180° view; however, vegetation in the form of upland moist mixed broadleaf/needleleaf forest obscures the view. The vegetation is comprised of spruce, birch, willow, lichen, and moss. The vegetation surrounding the estimated site area is denser than the vegetation covering the immediate site area and is primarily black spruce and moss. No surface exposure exists due to lichen and moss cover.

Site XBD-00369 was identified through subsurface testing. Two 50 cm x 50 cm test pits were excavated, one of which contained cultural material. One translucent white and black (5Y 8/1 with 2.5/N) 10-20 mm broken chert flake (UA2010-240) was collected at 30-40 cm BS.

Site stratigraphy consists of aeolian silts 19-39 cm thick unconformably overlying aeolian silts/decaying schist bedrock (Figure 22, Figure 23).

Figure 20. XBD-00369 overview (view to northeast)

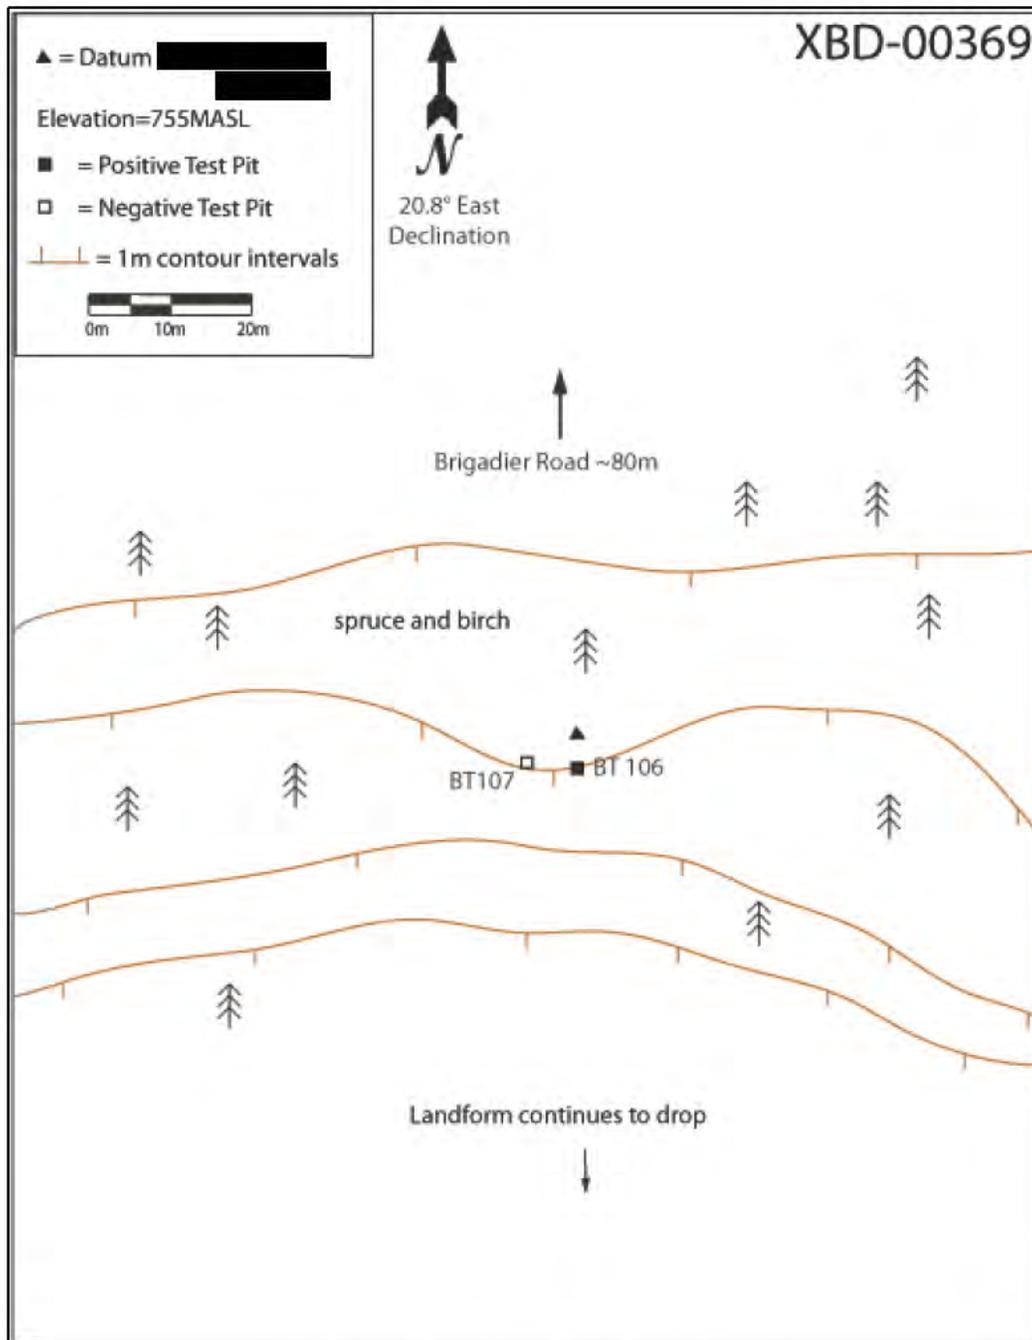

Figure 21. XBD-00369 sketch map

Figure 22. XBD-00369 test pit stratigraphy

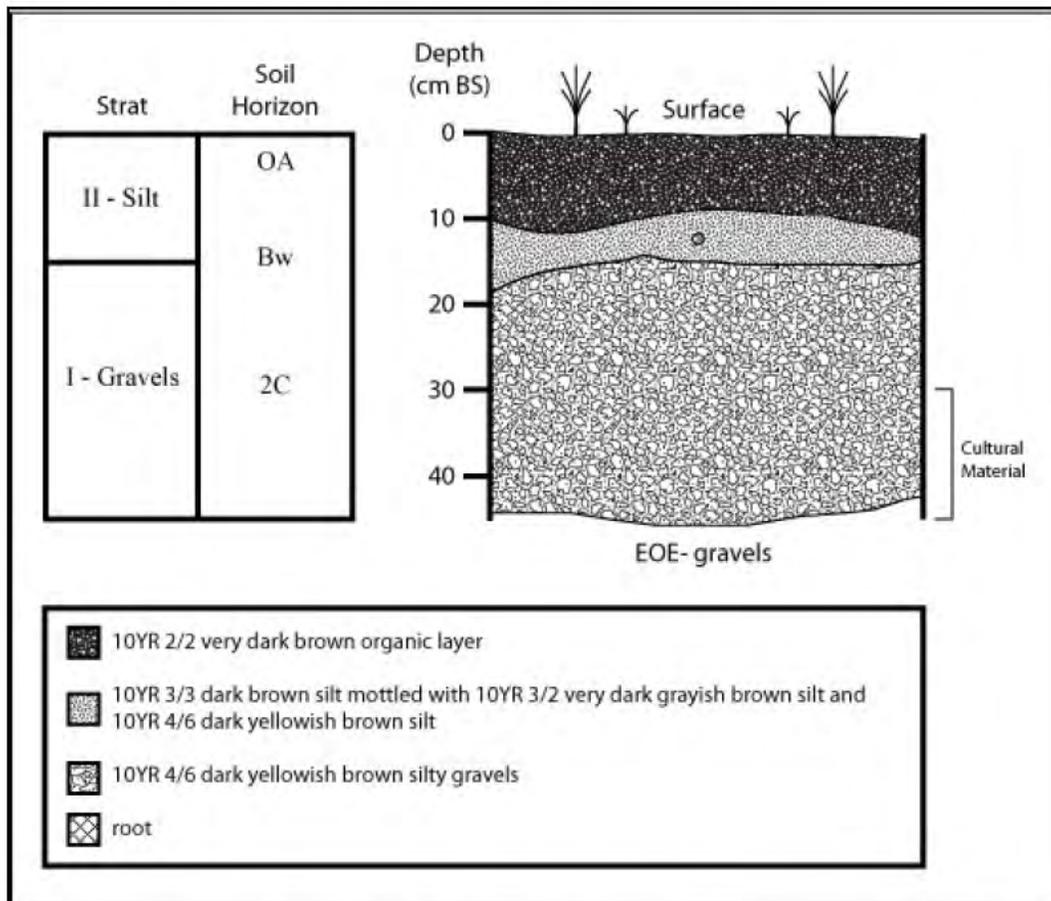

Figure 23. XBD-00369 stratigraphy

XBD-00370 (From previous 106 letter- SHPO concurrence 5/3/11)

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XBD-00370 is located near the crest of a large hill north of North Beaver Creek Road at UTM coordinates [REDACTED]. Site elevation is 712 masl. The site is situated at the base of a schist/quartz rock outcrop near the western crest terminus, 15 m south of a gravel two-track that splits off North Beaver Creek Road and bisects the hill west-east (Figure 24, Figure 25). The site occupies a fairly level bench in surrounding terrain that slopes sharply (15-35°) down to North Beaver Creek Road. North of the site, the terrain climbs briefly to the crest of the hill before dropping down to the Hunts Creek drainage at a 20-35° slope. Hunts Creek is approximately 1 km east of the site, is seasonally wet, and is the closest source of water. The site location provides a good viewshed to the south, despite being partially obstructed by trees.

The ecosystem is characterized by upland moist mixed needleleaf/broadleaf forest. Site vegetation includes spruce, birch, aspen, alder, willow, low scrub, and a dense moss and lichen ground cover. Surface exposure is 0%.

Site XBD-00370 was identified through subsurface testing. Cultural material was recovered from one of two 50 cm x 50 cm test pits, which yielded a single black (2.5/N) chert broken flake (UA2010-241), size class 5-7.5 mm at 0-10 cm BS. No tools were recovered from the site.

The site is situated at the base of a schist/quartz rock outcrop that rises approximately two meters above the surrounding ground surface (Figure 26). It is possible, if not likely, that the site represents the remains of a collapsed rockshelter that evolved in a scenario similar to that illustrated in Figure 14.

Site stratigraphy consists of aeolian silts containing a high concentration of schist pebbles, gravels, cobbles, and flagstones at least 50 cm thick overlying poorly sorted gravels extending to at least 80 cm BS (Figure 27, Figure 28).

3.3.2 2011 Archaeological Sites

XBD-00387 (From previous 106 letter- SHPO concurrence 11/22/11)

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

This site is located on a 2 m high rise north of Beaver Creek Road (Figure 29).

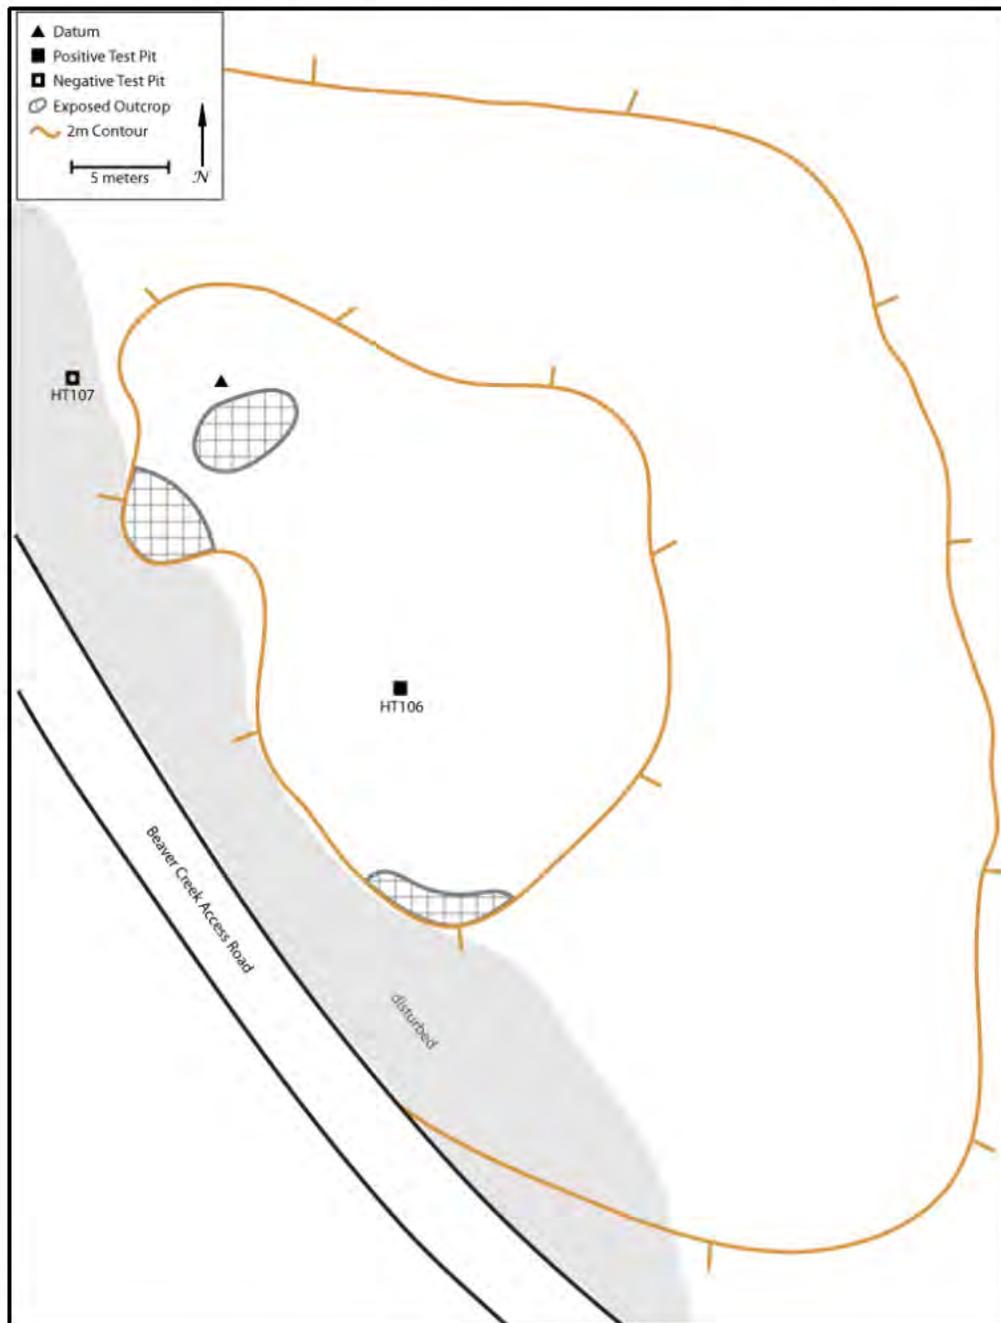

Figure 29. Map of XBD-00387

UTM coordinates are [REDACTED]. Spruce and aspen trees, alder shrubs, and willow shrubs composed the main site vegetation (Figure 30). The viewshed from the test pit location was 360°. Loess lies above shallow schist bedrock (test pit excavated to 33 cm below surface) (Figure 31, Figure 32). Five chert flakes (UA2011-433) were found in the root mat (0-7 cm below surface) of a single test pit adjacent to a modern fire pit. The flakes were made from black and gray chert and all consistent with late stage bifacial thinning and bifacial pressure flaking. Other test pits on the same landform were negative for cultural resources and showed significant ground disturbance (Figure 33).

4.0 TANANA FLATS TRAINING AREA (TFTA)

4.1 Introduction

TFTA encompasses 654,000 acres, located to the south and west of the Tanana River (Figure 34). Extending 32 miles south of Fairbanks, it occupies the majority of the land between the Wood and Tanana rivers. The area is located in the Tanana-Kuskokwim lowlands (Wahrhaftig 1965) and is characterized by several topographically high features on the landscape: Clear Creek Buttes; Wood River Buttes; and the highlands surrounding Blair Lakes, which contain the highest point in the flats—a hill that rises to an elevation of 426 masl. The flats were formed by the northern migration of the Tanana River in response to uplift and orogeny associated with the Alaska Range to the south. The majority of the area is composed of recent deposits and alluvium. Higher landforms such as Wood River Buttes, Clear Creek Buttes, and the Blair Lakes hills are bedrock knolls capped by a thin mantle of aeolian silt (loess).

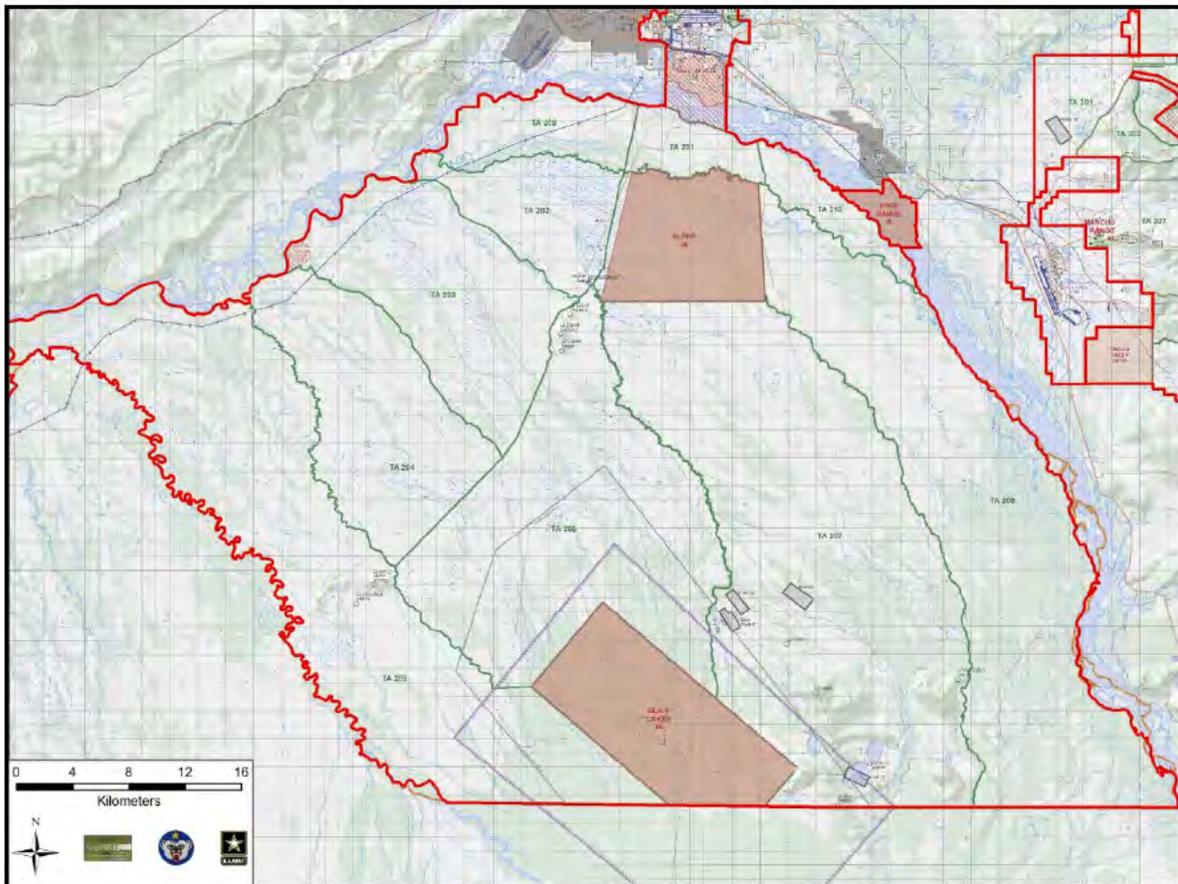

Figure 34. TFTA

TFTA encompasses a large area and a wide array of physiographic features. The area contains three main vegetation types: treeless bogs, open low-growing spruce forests, and closed spruce-hardwood forests. Forests in the Tanana Flats include black spruce in low, poorly-drained areas and spruce and mixed hardwood (poplar, birch, and aspen) in upland areas. Lowlands are mainly covered with herbaceous marsh and shrub wetlands.

4.2 TFTA Surveys

Although portions of TFTA have been surveyed for archaeological sites since the 1970s (Clear Creek Buttes, Wood River Buttes, Blair Lakes), systematic surveys in the training area didn't begin until 2008 (Figure 35).

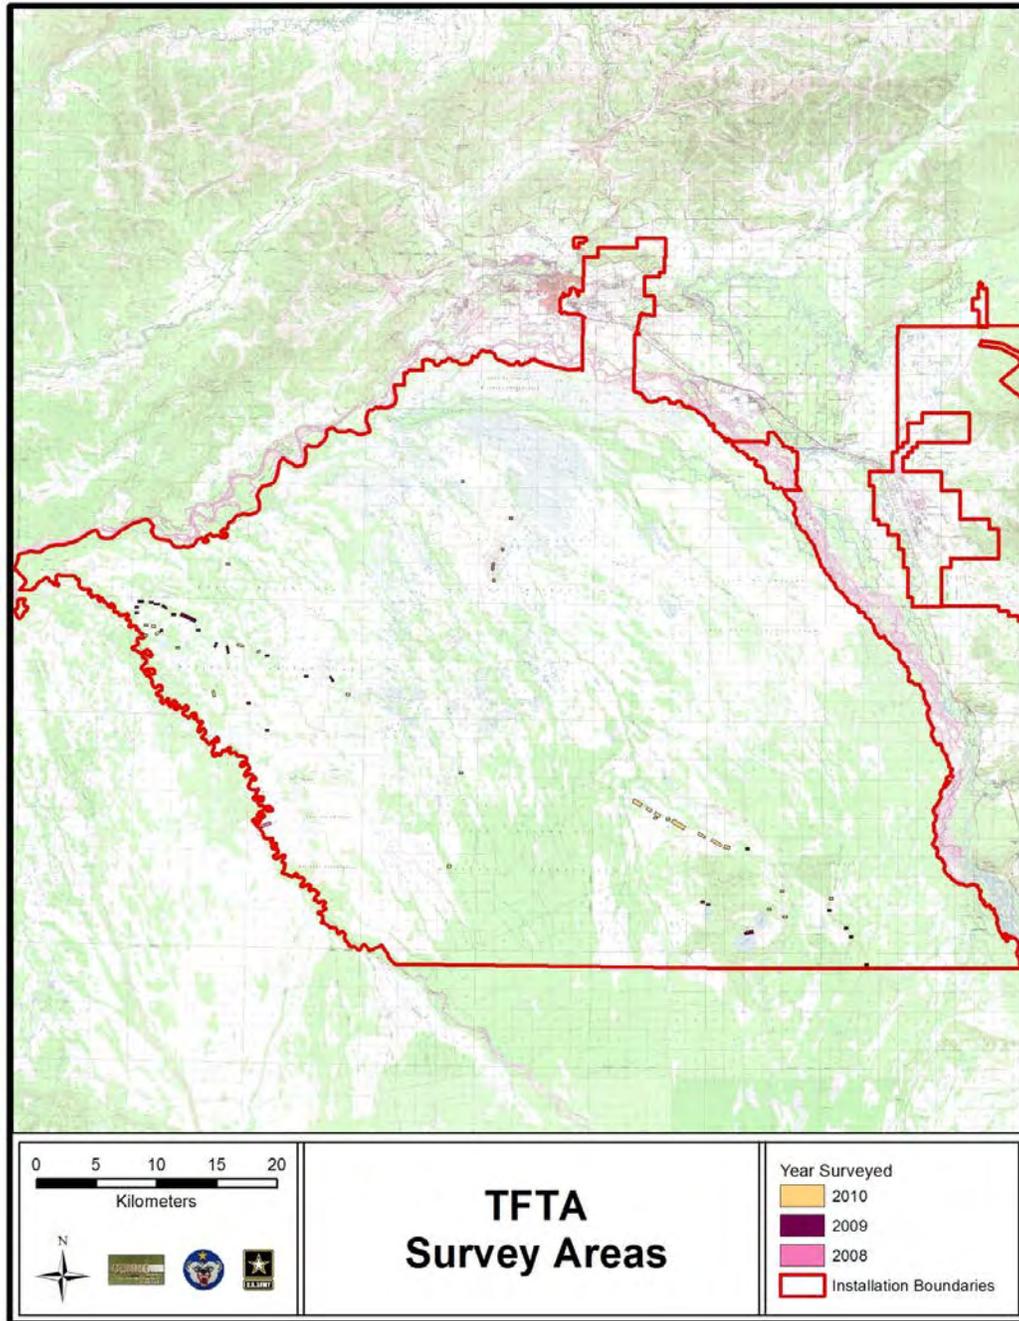

Figure 35. TFTA survey areas by year

During the summer of 2010, Colorado State University's CEMML archaeologists continued a judgmental survey from 2008 and 2009 (Gaines 2009; Gaines et al. 2010) of three main

physiographic regions of TFTA: (1) a vegetated dune field east of the Wood River, (2) low bedrock knolls north of Clear Creek, and (3) an alluvial terrace and uplands in the vicinity of Blair Lakes (Figure 36). No surveys of TFTA took place during the 2011 field season.

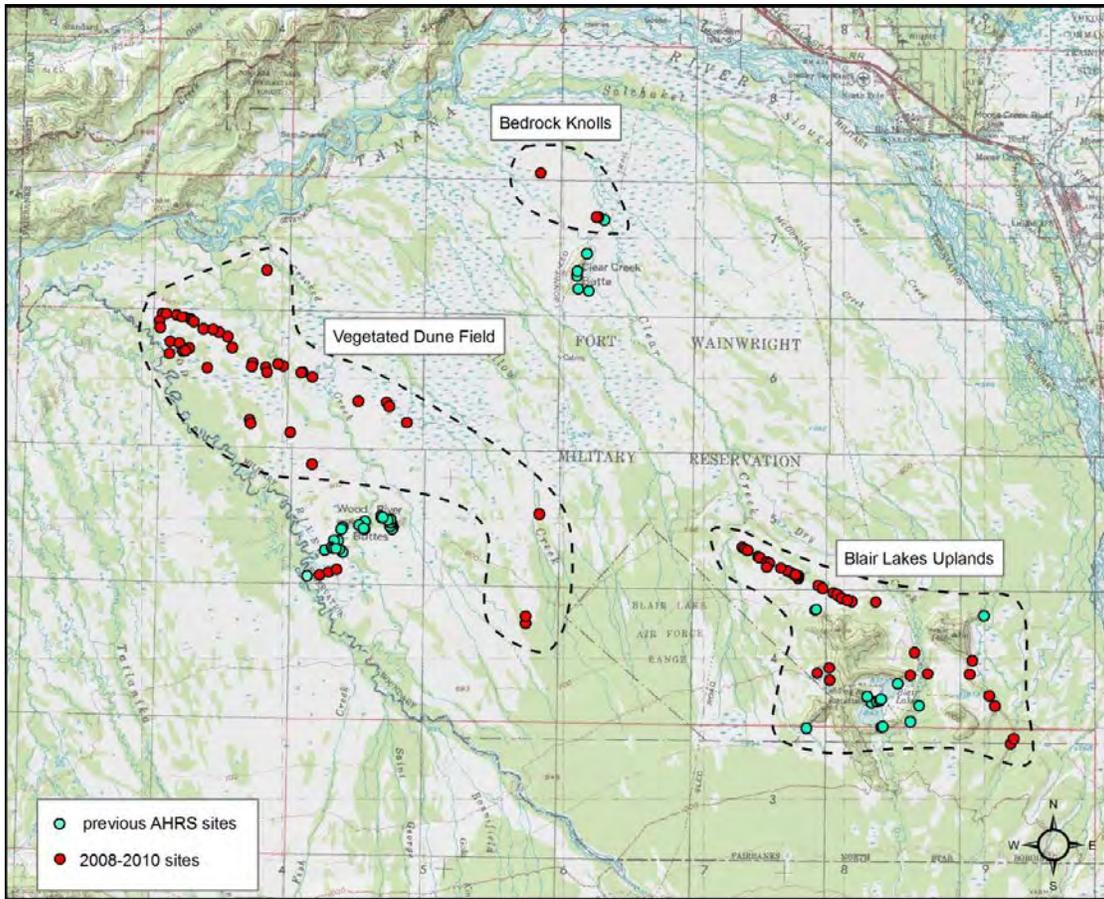

Figure 36. TFTA physiographic regions surveyed during 2010

4.2.1 Blair Lakes Vicinity: Alluvial Terrace Edge and Uplands

The Blair Lakes and surrounding hills are located in the southeastern portion of TFTA, immediately west of the Tanana River. The Blair Lakes consist of Blair Lake North (266 acres), Blair Lake South (557 acres), Pork Chop Lake (118 acres), and Anne Lake (255 acres). Lake formation occurred during the late Pleistocene as a result either of rapid aggradation of Dry Creek, tectonic faulting, or a combination of the two. Elevated beach ridges on the east shore of Blair Lake North indicate higher lake levels during the terminal Pleistocene or early Holocene and, on the basis of their elevation, indicate that the two lakes would have been connected during this time (Dixon et al. 1980).

Select areas in the Blair Lakes vicinity were targeted for archaeological survey during 2010 as part of long-range planning related to possible range developments in TFTA. Fieldwork was conducted by a team of seven CEMML archaeologists under the supervision of Edmund Gaines, M.A., R.P.A. during July and August 2010. Field methods consisted of rotary wing and fixed

wing aerial reconnaissance to select high-probability locations for ground survey and testing. Ground survey consisted of visual surface inspection, and subsurface testing consisted of 50 x 50 cm shovel tests screened through ¼” mesh.

The 2010 survey area can be roughly divided into two general landforms: (1) an alluvial terrace, and (2) the Dry Creek drainage and adjacent knoll. A prominent terrace edge punctuates the landscape north and east of the Blair Lakes. It is comprised of alluvial deposits (Péwé et al. 1966) that create a roughly north/south to southeast/northwest trending bench that rises 15-25 m above the abandoned Tanana River floodplain alluvium below. An unnamed hill northeast of Blair Lakes punctuates the terrace edge. At this higher landform, the terrace turns and extends at a roughly NW direction for roughly 15 km before it gradually subsides to the flats below. The eastern portion of the terrace was targeted as high-probability area for ground survey during 2009 identifying four prehistoric archaeological sites (Gaines et al. 2010). These efforts continued north and northwest during 2010. Survey efforts focused on 38 high-potential areas along the northwestern terrace edge, resulting in the identification of 33 prehistoric archaeological sites. All but two of these were found through subsurface testing. Additional efforts were focused on the Dry Creek alluvial system and an adjacent low hill, just north of Blair Lake North. Occupying an area of roughly 31 km², the hills and ridges surrounding Blair Lake are composed of metamorphic rocks, primarily Birch Creek schist. These uplands rise from the surrounding outwash terrace and contain the highest point in TFTA – an unnamed hill that rises to an elevation of 426 masl. Dry Creek is an ephemeral stream with several low gravel terraces and low knobs overlooking the channel. The hill north of Blair Lake South is composed of schist bedrock capped by a mantle of aeolian silt. Six high-probability areas were targeted for ground survey during 2010 in this area, resulting in the identification of three prehistoric archaeological sites.

4.2.2 Dune Field

The northwestern portion of TFTA contains a 45 km²/19,255-acre, discontinuous vegetated sand dune field that occupies a triangular area east of the lower Wood River, south of the Tanana River and north of the Wood River Buttes (Figure 37). Topographically, the dune field is dominated by a northeast-southwest trending linear dune complex that extends roughly 5 km, is 200-800 m in width, and rises as high as 45 m above the surrounding flats. This represents the most obvious dune feature and has received the most attention from the limited research in the area (e.g., Dixon et al. 1980: 215). This feature and a few of the larger dunes to the south and west appear on USGS geologic and topographic maps of the area (Péwé et al. 1966; Figure 38). Low-speed, low-elevation overflights of the area conducted by CEMML during 2009 and 2010 revealed the presence of several dozen additional linear, parabolic, and ovate sand dunes diffusely spread over a 40 km²/16,900 acre area to the south and west of the linear dune complex. In many places the dunes surround undrained depressions, old ponds, and relict stream channels.

Geologically, the dune field remains relatively unstudied, and there is much to learn in terms of dune morphology, timing of and paleoenvironmental factors influencing dune formation and stabilization. The existing literature (e.g., Péwé 1975; Péwé et al. 1966; Hopkins 1982; Lea and Waythomas 1990) tends to associate this dune field with the extensive Nenana Dune field located more than 35 km to the west (Collins 1985). The dunes were probably formed from

sands derived from the Tanana River during full to late glacial times. Some researchers (e.g., Lea and Waythomas 1990) hypothesize late glacial to early Holocene dune formation from existing full-glacial sand sheets throughout much of central Alaska. Given large areas of reworked sand deposits on the margins of the dunes in Tanana Flats, such a scenario might account for dune formation here. Final dune formation likely occurred during the latest Pleistocene, with subsequent early Holocene dune stabilization and vegetation. This notion is supported by an inferred terminal Pleistocene increase in wind intensity in central Alaska during the Younger Dryas (Bigelow et al. 1990).

Lithologically the dunes consist of very fine to medium aeolian sand, and reworked organic silty sand. Both deposits are capped by aeolian silt from 1 to 3.5 m thick. Vegetation in the dunes is dominated by broadleaf and mixed broadleaf-needleleaf forests associated with better drained soils. The dunes are surrounded by abandoned floodplain alluvium on the north and west, swamp deposits on the east and Holocene-aged outwash in the south and central portions.

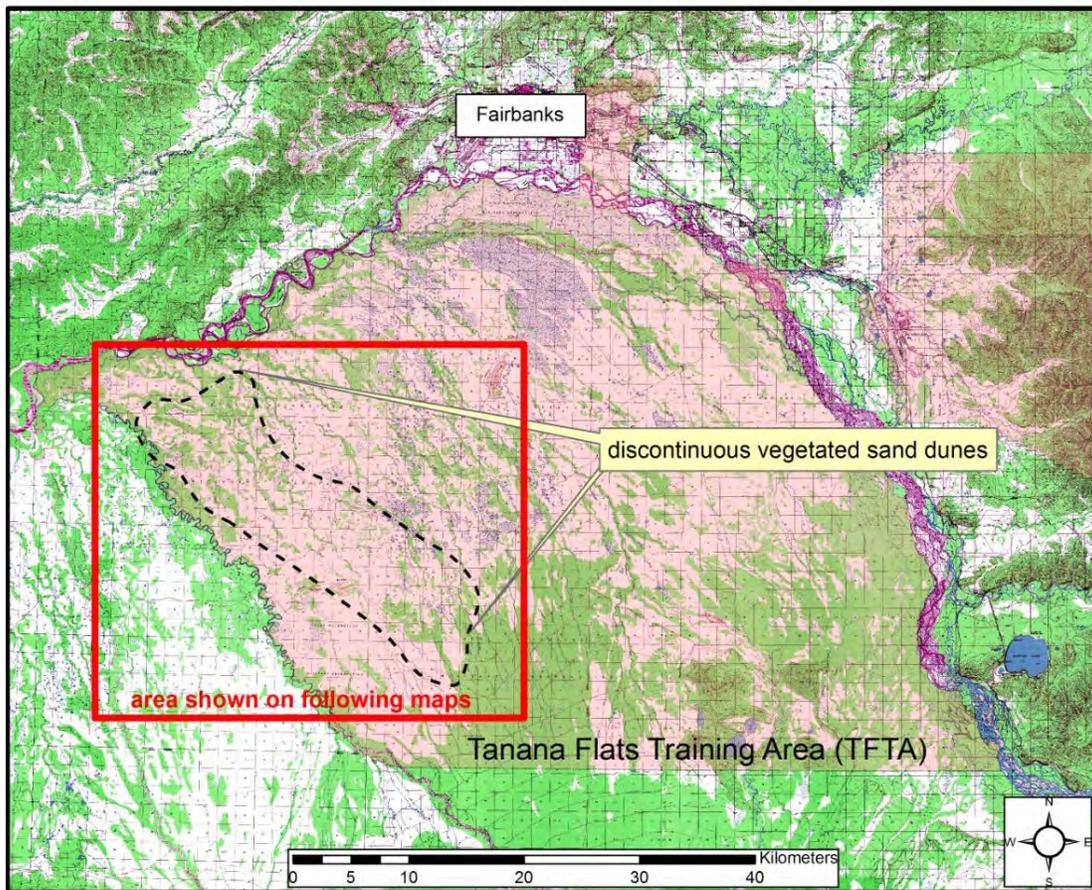

Figure 37. Location of stabilized dune field in TFTA

The dunes were subject to archaeological survey during 1979 (Dixon et al. 1980: 33, 48, 217-218). No sites were identified during at the time, despite the fact that over 495 shovel test pits were excavated. The recent dune field survey was initiated in 2009 by CEMML, with 25 prehistoric sites found in the initial survey.

The dune field was targeted for archaeological survey during 2010 as part of a long range planning and feasibility assessment related to potential range development in TFTA. Fieldwork was conducted by a team of five CEMML archaeologists under the direct supervision of Edmund Gaines, M.A., R.P.A. during August 2010 using the same field methods described above.

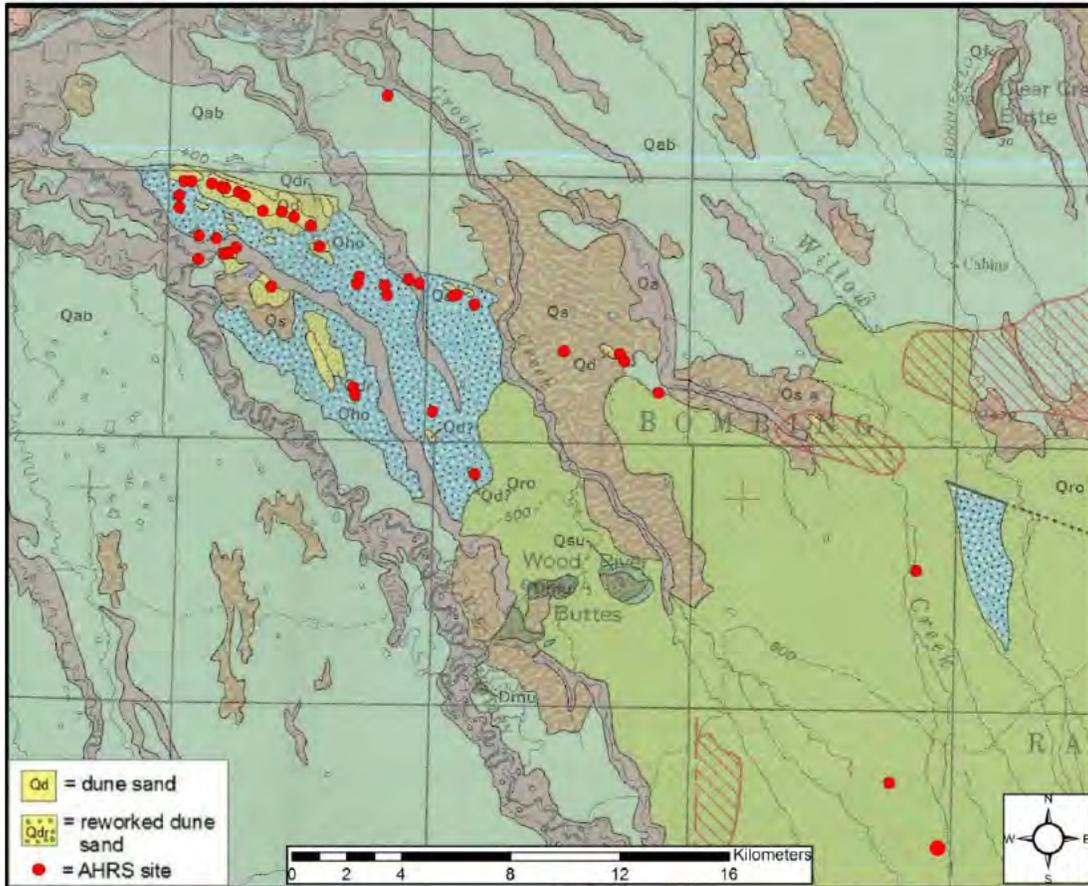

Figure 38. Geologic map of dune field and AHRs sites (adapted from Péwé et al. 1966)

4.2.3 Bedrock Knolls

The northern portion of TFTA is punctuated by a series of bedrock knolls. These are composed of Precambrian Birch Creek schist bedrock and covered with a thin (50-150 cm) mantle of loess. The larger knolls, such as Clear Creek Buttes and Wood River Buttes, rise to an elevation of 300 masl. These features are readily identified on a USGS topographic map. One of the initial archaeological surveys of TFTA conducted by Dixon et al. (1980) targeted these higher, readily identifiable landforms, resulting in the identification of five sites on Clear Creek Buttes (Clear Creek Buttes Archaeological District) and 25 sites on Wood River Buttes (Wood River Buttes Archaeological District). There are, however, several lower, smaller knolls to the north of Clear Creek Butte. Due to their low elevation, most of these do not appear on USGS topographic maps but are identifiable by low-speed, low-elevation flyover. One of these low landforms, Salmon Loaf Butte, is home to one site identified in 2001 and two sites identified in 2008 (Gaines et al. 2009). During 2010, an additional low knoll was selected for ground survey. The knoll was

initially identified as a high-probability landform during snow machine reconnaissance in January 2010. This survey identified one archaeological site.

4.3 TFTA Sites

TFTA is currently home to 140 known prehistoric sites and 7 historic sites (Table 3, Figure 39).

Table 3. Archaeological sites in TFTA

Three archaeological districts – Clear Creek Buttes Archaeological District (five sites on the crest of Clear Creek Buttes), Wood River Buttes Archaeological District (27 prehistoric sites located among the Wood River Buttes), and Blair Lakes Archaeological District (four prehistoric sites and two historic sites located on north shore of Blair Lake South) – are also located in this training area. Eleven sites are eligible for the NRHP, two are not eligible, and 134 have not yet been evaluated (Table 3). Fifty-four new sites were discovered in 2011. They are described below.

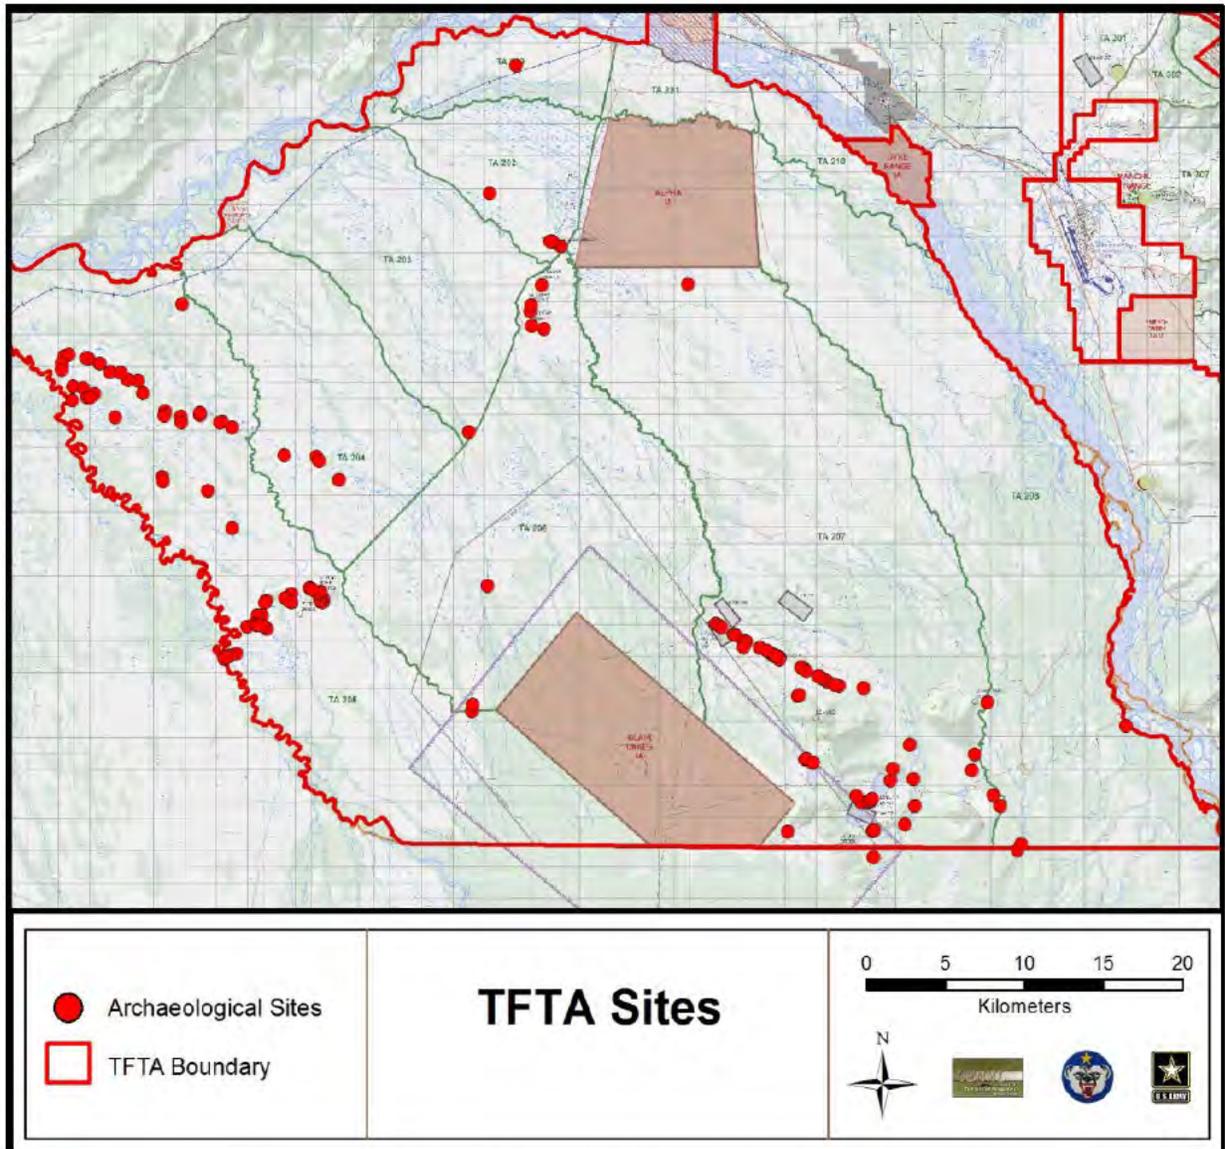

Figure 39. TFTA archaeological site locations

4.3.1 Alluvial Terrace Edge Sites

Thirty-six archaeological sites were found in 2010 along the alluvial terrace edge, Dry Creek, and the adjacent knolls (Figure 40). One of these sites, FAI-02043 was especially significant for its deep stratigraphy, multiple cultural components, and late Pleistocene radiocarbon dates. Test excavations at this site, as well as preliminary data for all other sites, are provided in this section.

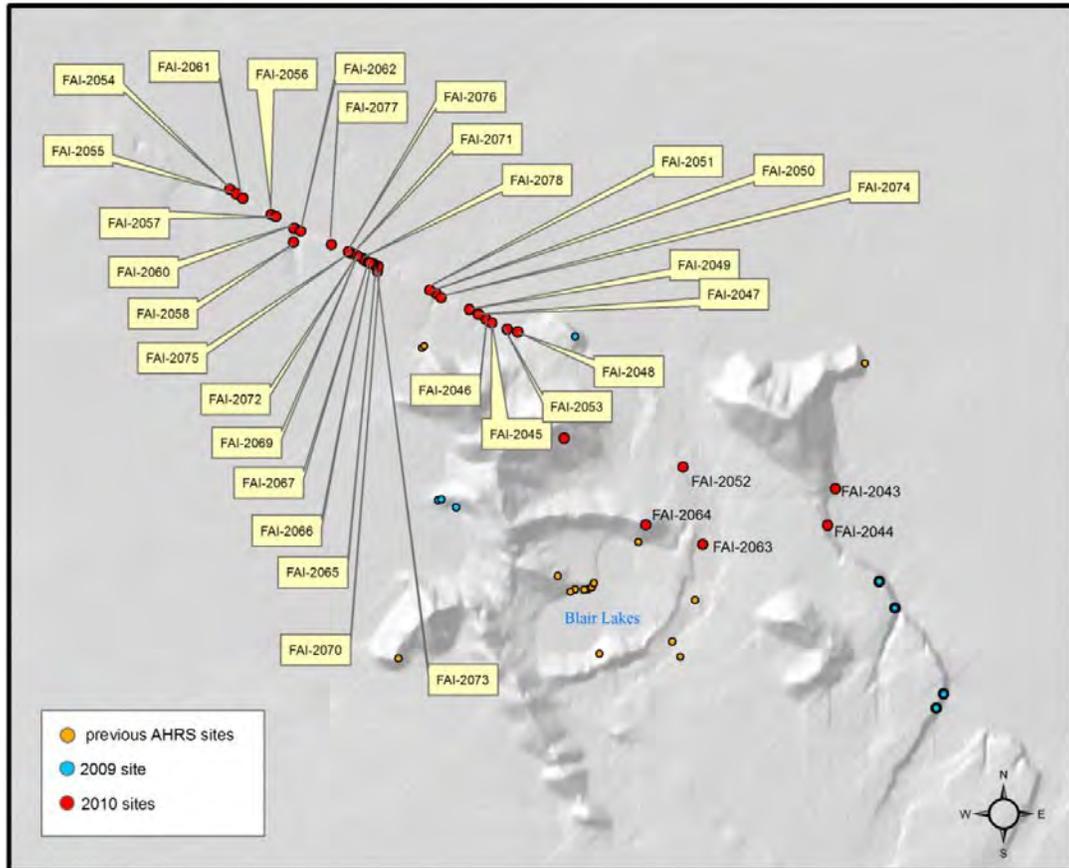

Figure 40. Locations of terrace edge sites discovered in 2009 and 2010

FAI-02043

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Eligible (See DOE form in Appendix 1)

Site FAI-02043 is located at the foot of a large bedrock knoll, roughly 7 km east of the Blair Lakes at UTM coordinates [REDACTED]. Site elevation is 260 masl. The site is located on a roughly 100-m-wide promontory that juts around 200 m to the east of prominent bedrock knoll where it interfaces with a north-south running terrace edge (Figure 41, Figure 42). Site slope is 0-3%. The east, north, and south sides slope at ~25%-35%, dropping 20-25 m to the flats below, while to the west and northwest, the landform gradually

rises up to the knoll above (Figure 43). The vantage point provides a commanding view to the east of the flats below, the Tanana River Valley, and Flag Hill. The ecosystem is characterized as mixed needleleaf-broadleaf forest with an understory of young birch, some alder, shrubs and forbs (Figure 44, Figure 45). There is little (5-10%) surface exposure on the site area; however, the slope to the east exhibits large bare patches over 50-60%.

Site Discovery

Site FAI-02043 was identified through subsurface testing. At the time of discovery, 94 flakes were recovered from four of four test pits excavated (Appendix 2); two of these tests also yielded unidentifiable large mammal faunal fragments. Shovel testing suggested that the site contained at least two components: one at ~0-45 cm BS and another deeply buried in the lower loess and basal sands at 90-120 cm BS. Three of the four test pits, those nearest the edge of the landform, reached basal gravels at 100-130 cm BS, while one test pit (AT 50) was excavated to the depth possible with a shovel, terminating at 140 cm BS without finding the bottom of the basal sands.

Test pit AT 50 provided a piece of charcoal associated with flaked stone roughly 2 cm above the loess/sand contact that dated to $10,730 \pm 50$ ^{14}C years BP (Beta-281235), demonstrating the antiquity of the lower component. Dispersed charcoal found in association with flakes in the upper component at 22 cm BS produced a date of 6460 ± 40 (Beta-283427), revealing the presence of a middle-Holocene occupation.

Site Testing and Unit Excavation

Several factors pointed to the need to more thoroughly characterize the archaeological environment of this area of TFTA. In 2009 and 2010, five other buried prehistoric sites were found on the same landform within 1.4-6 km, and an additional 14 sites were found on the same alluvial terrace 10-20 km to the northwest. Site FAI-02043 has a demonstrated occurrence of deeply buried artifacts associated with a $10,730 \pm 50$ ^{14}C years BP date. This date came from a position more than 50 cm higher than the deepest test and 20 cm above the lowest extent of cultural material, indicating the potential for even more ancient remains. The site also yielded large faunal fragments, which are a rarity in Interior Alaska. Given the poorly understood nature of cultural resources in the area and to assist range development planning, a research design was developed to better understand the archaeological resources at FAI-02043 and in the vicinity.

The overarching goal of site testing was to assess the significance of prehistoric cultural material in the area. This was accomplished through: (1) a strategy of testing deep stratigraphic deposits for the presence of archaeological materials, (2) expanding test pit AT50 to a 1 x 2 m excavation unit, (3) characterizing site stratigraphy, (4) characterizing landform geomorphology, and (5) determining dates of prehistoric occupation. Test excavations were conducted from August 5-12 and October 3-10, 2010, by a four-person CEMML crew under the direction of Edmund Gaines.

In order to address these research objectives, a total of 2 m² were excavated to a depth of about 135 cm BS. A 1 x 2 m excavation unit (Figure 46, Figure 47) expanded off of shovel test AT50, located in the northwest corner of the excavation unit. A metric grid system maintained horizontal control, with the southwestern corner of the excavation unit designated 500N (north)/100 E (east). Excavation took place in two excavation units: Excavation Unit 1 (EU1) from 500-501N, 100-101E; and adjacent Excavation Unit 2 (EU2) at 501-501N, 100-101E. The resulting 2 x 1 m excavation block extends from 500-502N, 100-101E.

A datum placed in the southwestern corner of the excavation unit at UTM coordinates 489017E; 7139975N (Trimble NAD 83) maintained vertical control throughout the course of excavation. All elevation measurements performed during the course of excavation were taken in reference to this vertical datum utilizing string line and level. The initial datum, Datum A, was set at a height of 4.5 cm above the ground surface in the southwestern corner of the excavation unit. During the second phase of excavation in October, a new datum, Datum C, replaced Datum A. Datum C was established in roughly the same spot as Datum A at a height of 3 cm above ground surface.

A total of 14 levels were excavated (Table 4), extending the excavation roughly 35 cm into the basal sands and at least 15 cm deeper than the lowest recovered artifact. The upper five levels to a depth of 75 cm BS were shovel skimmed and screened through ¼” mesh. Roughly 10 cm above the depth of artifacts known from initial shovel testing, one level was excavated via trowel and 1/8” screen to a depth of 85 cm BS. Upon encountering artifacts, levels were excavated in 5 cm increments via trowel and sifted through 1/8” screen. This excavation strategy was continued throughout the entire extent of cultural deposits. Roughly 10 cm below the depth of the lowest artifact recovered at 115 cm BS, shovel skimming and sifting through ¼” screen were resumed to ensure that excavations proceeded well into sterile deposits. Table 4 details excavation levels, depths (cm BS), the strata excavated, and methods:

Table 4. FAI-02043 unit excavation levels, depths, strata, and methods

Level	cm BS (±3)	Stratum	Methods	Screen
1	5-15	10yr4/6 dark yellowish brown silt, OA	shovel skim	1/4"
2	15-25	10yr4/6 dark yellowish brown silt, OA	shovel skim	1/4"

13	115-125	sand	trowel	1/8"
14	125-140	sand	shovel skim	1/8"

Collection and Documentation

All cultural material was collected and information recorded in accord with USAG FWA standards outlined in the ICRMP (CEMML 2001) and UAF Museum of the North collection requirements. An attempt was made to identify all cultural material *in situ* and record the precise 3-point provenience. Such materials were assigned a distinct PL (point located) number, their precise provenience recorded, and then individually bagged. Materials found in the screen were separated according to artifact type (e.g., bone, lithics ...) and bagged according to excavation unit, sub-quad when possible, and level/depth. Provenience information was recorded on artifact bags, in a field specimen (FS) log, on drawn plan views, and in the case of X, Y, Z located artifacts, in the PL log.

Excavation information consisting of plan views, stratum/level descriptions and measurements, field specimen data were recorded on standardized archaeological recording forms. All of this information was also recorded in individual excavator’s notebooks as well as the field director’s

notebook. Profiles were drawn to scale on metric graph paper. The PL log was kept in a separate notebook. Digital photos documented the site and excavation process. Artifacts, samples, stratigraphic profiles, excavation processes and overviews, as well as aerial views, were photo-documented throughout all stages of excavation. A total of 798 photos were taken, ensuring comprehensive photo-documentation of the excavation process. All photos were logged in a separate notebook that served as the dedicated photo log.

Additional site testing consisted of a single shovel test (AT 291) excavated roughly 20 m to the north of the excavation unit. In order to test the depth of basal gravels across the landform, a series of five auger tests were conducted. One of these was placed in the bottom of test pit AT50 adjacent to the excavation unit.

Testing Results: Excavation

Levels 1-5 of the excavation unit produced no cultural remains. Artifacts were recovered from Levels 6-13. The basal level, Level 14, was 25 cm thick and excavated into entirely sterile deposits. Figures 48 through 58 detail the location of lithics and bone in each excavation level.

A total of 1,106 pieces of lithic debitage and 538 faunal fragments were recovered from the excavation unit. In addition, two cobble hammerstones and at least four enigmatic angular rocks, likely manuports, were recovered from the lower zone of cultural material. Lithic and faunal material was recovered from depths of 75 to 125 cm BS; however, the continuous bell-shaped distribution of frequency of both artifact types by depth prevents separating components at the current phase of investigation.

Recovered tools were rare and only include two artifacts. One is an irregularly shaped small biface (Figure 59) made of gray rhyolite (10YR 6/1). It measures 29.4 mm maximum length, 13.8 mm maximum width, and 7.4 mm maximum thickness. It is completely covered on both faces by fine sub-parallel pressure retouch and displays a snap break on its proximal margin. The second tool recovered is a scraper fragment made on a flake (27.9 mm long, 11.75 mm max width, 2.1 mm max thickness) (Figure 60). It displays snap breaks on both lateral margins. The distal margin is 11.75 mm wide; the entire extent of which is covered by fine sub-parallel pressure retouch.

Figure 60. FAI-02043 scraper fragment

With the exception of the tools described above, all of the recovered flaked stone is small (<10 mm diameter; Table 5; Figure 61) tertiary debitage characterized as broken flakes, flake fragments and flakes reflective of late-stage reduction and tool maintenance. Rhyolite is the major material type, comprising 73% of the assemblage (n=807). Other material types include (chert 12%; n=132), basalt (15%; n=163), two pieces of obsidian, and one piece of silicified silt/mudstone (Table 6, Figure 62).

13	4	2	10	0	0	0

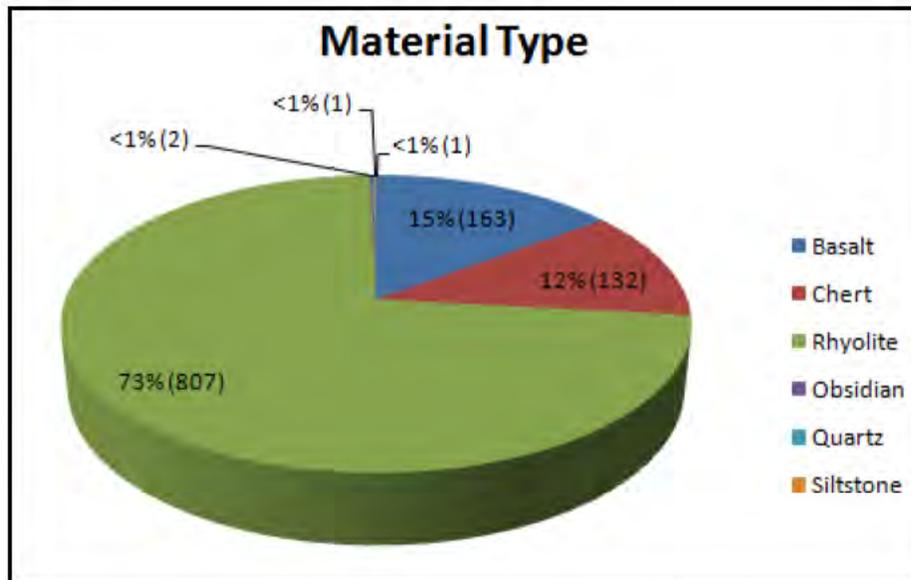

Figure 62. FAI-02043 material type frequency

The majority (96%; n=520) of the faunal remains are unidentifiable fragments (Table 7, Figure 63). Some are very large mammal (moose/bison sized) long bone fragments exhibiting breakage patterns characteristic of green bone fractures. Identifiable faunal remains (Appendix 3) consist of an Alaskan hare (*Lepus othus*) astragalus (Figure 64), a vertebrae and sternum from a goose/swan-sized waterfowl (*Anatidae* sp.) (Figure 65 and Figure 66), and a *Bison* sp. permanent M₃ molar (Figure 67). A specimen identified as red-backed vole (*Myodes rutilus*) is likely intrusive as it represents a nearly complete individual, is in a much fresher state of preservation than the other faunal specimen, and was found in the vicinity of a krotovina.

Table 7. FAI-02043 faunal fragment size count/level

Level	Size Range						
	0-5mm	5-7.5mm	7.5-10mm	10-20mm	20-30mm	30-40mm	>40mm

Two rounded cobbles were found in the lowest component. The first of these (FS 174; Figure 68) is 78.3 mm long, 45.1 mm wide, and 20.9 mm thick. It has slight pitting on one end, indicating that it served as some sort of hammerstone. The second cobble (FS 605, Figure 69) is 81.2 mm long, 61.9 mm wide, and 44.3 mm thick, and weighs 269.115 g. It displays no pitting. Eight other angular to subangular rocks between 17.74 and 60.44 g in weight and between 20-50 mm in diameter were recovered. The presence of large rocks in an aeolian silt and sand deposit indicates that they may have been transported to the site by human agents.

Figure 68. FAI-02043 cobble/hammerstone (FS 174)

Figure 69. FAI-0243 cobble (FS 605)

Testing Results: Test Pit AT 291

Concurrent to unit excavation, test pit AT 291 was excavated roughly 20 m to the north of the excavation unit. The test pit produced over 330 flakes of lithic debitage (Appendix 2) and several green-fractured, large mammal long bone fragments (Figure 70; Figure 71, Figure 72). A piece of charcoal was found in direct association with bone fragment and flake at 100 cm BS. This produced an AMS (atomic mass spectroscopy) ^{14}C date of $11,600 \pm 50$ (Beta 283430).

Figure 70. Fauna and ^{14}C -dated charcoal from test pit AT 291

Figure 71. AT 291 green-fractured, large mammal long bone fragment in Stratum II sand matrix (note associated flake)

Figure 72. AT 291 green-fractured, large mammal long bone fragments in Strat II sand matrix

Three AMS ^{14}C dates were obtained from dispersed charcoal in very close association with cultural material. In all cases, the charcoal selected for dating was physically touching flakes. The samples were collected with steel instruments, either a trowel or dental pick, then stored in tinfoil and archival-quality plastic bags. All were submitted to Beta Analytic Laboratories for analysis, where they underwent standard pretreatment including physically removing rootlets and identifiable contaminants and an acid-base wash.

Table 8 presents the results of AMS determinations. Sample Beta # 283427 was collected from test pit AT 49 at the time of site discovery and represents a secure date for the upper component; sample Beta #283435 was collected from test pit AT 50 also the time of discovery and is a good date on the upper portions of the lower component. Sample Beta #283430 was collected during site testing from the lowest portions of the lower component. It was physically touching a flake and bone fragment (Figure 70) and is a secure date for the lowest portions of the lower component.

Table 8. AMS ^{14}C dates from FAI-2043

Material	Beta Lab#	C12/C13	Y BP	2 Sigma Cal	Depth (cm BS)	Strat
charcoal	283435	-25.3	10130 ± 50	11600-11990 Cal BP	22	upper Strat III silt; base of Bw
charcoal	283427	-26.3	6460 ± 40	7270-7430 Cal BP	90	lower Strat III silt, near II/III
charcoal	283430	-22.4	11600 ± 50	13330-13570 Cal BP	100	upper Strat II sand

Three general lithostratigraphic units were defined. These consist of basal gravels (Stratum I) overlain by thinly bedded aeolian sand (Stratum II), which is in turn capped by 100-150 cm of massive loess (Stratum III). Soil development noted in the field consists of modern boreal forest O/A/B/Bw horizons (Typic Chryocrypt), with a series of buried Bw horizons in the middle to upper Stratum III loess. Augering revealed that both the thickness and weathering of Stratum III loess was relatively uniform across the site. Stratum III sands varied in thickness from roughly 1 m thick near the point of the local landform to 3.5 m thick at the excavation unit to roughly 5 m thick at the northern extent of augering roughly 20 m north of the excavation unit. In general, site stratigraphy was observed to be relatively uniform where observed in the test pits,

excavation unit and auger tests. As such, it allowed for the development of generalized composite stratigraphic profiles detailed in Figure 73 and Figure 74.

Figure 73. FAI-02043 Excavation unit north wall stratigraphy, soils, and ¹⁴C dates

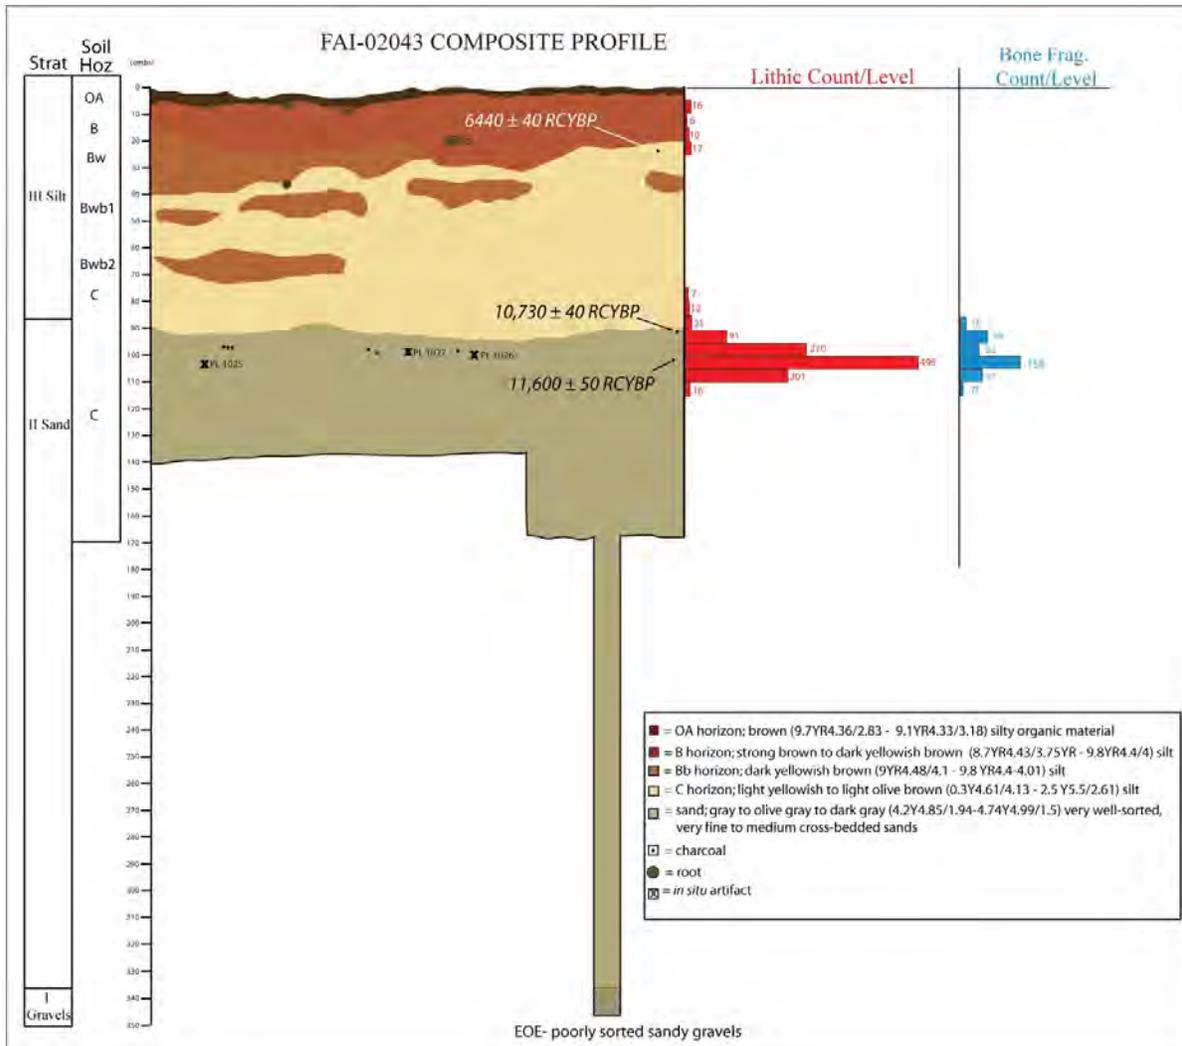

Figure 74. FAI-02043 composite profile

Discussion and NRHP Eligibility

While the sample from FAI-02043 is limited thus far, several robust inferences are possible. Cultural zone (CZ) 2 is coeval with Upward Sun River component C1, Broken Mammoth component CZ 4, the lowest Mead components, Swan Point CZ4, and four components in the Nenana Basin (Goebel et al. 1996; Goebel and Bigelow 1996; Hoffecker 1996; Holmes 1996; Pearson 1997; Potter et al 2008, 2010, 2011). The character of the lithic and faunal assemblages from this site is most similar to Broken Mammoth CZ 4 and Upward Sun River C1 with abundant lithic debitage and few formal tools. The presence of large and small game and waterfowl is also very similar to the Upward Sun River C1 and Broken Mammoth CZ 4 faunal assemblages and provides further evidence of broad-spectrum hunting strategies in late Pleistocene Eastern Beringia. The long bone breakage patterns and associated cobbles indicate marrow extraction. The presence of waterfowl suggests an early summer to fall occupation.

Site FAI-02043 is an intact, deeply buried prehistoric archaeological site with demonstrated integrity and cultural components that are among the earliest in Alaska and the entire North American continent. The spatial and stratigraphic integrity of the components, the presence of well-preserved identifiable fauna, and dateable organic remains indicates the potential to yield significant information on the earliest populations of Alaska and the New World, contributing to a broader regional and continental context. Site FAI-02043 is eligible under NRHP Criteria D for its potential to yield information important to understanding the prehistory of the region.

It is important to note that the site boundaries have not been determined, but are potentially extensive. Cultural deposits could occur across the entire 20,000 m² flat area on the top of the landform.

Given the NRHP eligibility and significance of the site and undefined site boundaries, if range development projects are proposed in the vicinity, a strategy to mitigate adverse effects to the site must be implemented. The first step of this mitigation should be properly defining site boundaries.

FAI-02044

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination: Not Evaluated

Site FAI-02044 is located on a 20 m x 10 m finger that extends to the east/southeast from a north-south trending alluvial terrace edge at UTM coordinates [REDACTED] (Figure 75, Figure 76). Site elevation is 248 masl. The site has a 180° viewshed of the Tanana River Valley to the north. Two small ponds are visible to the northwest. The site area is generally level, while the adjacent terrace slope drops 10–15 m at approximately 35° to the valley below. The local landform is approximately 20 m wide north-south; drainages on both sides isolate it from the larger north-south running terrace.

The site ecosystem is characterized as upland moist mixed needleleaf/broadleaf forest (Figure 77). Site vegetation consists of mature aspen surrounded by mixed aged spruce and birch. The understory is alder, wild rose and low scrub, with a dense moss and lichen ground cover. Surface exposure is 0%.

Site FAI-02044 was found through subsurface testing. Cultural material was recovered from one of two test pits excavated. A single black (2.5/N) chert broken flake (UA2010-186), size class 10-20 mm, was recovered at a depth of 49-59 cm BS. Site stratigraphy consists of aeolian silts at least 100 cm thick; both test pits encountered frozen ground at 100 cm BS and were terminated at this depth (Figure 78, Figure 79).

FAI-02045

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination: Not Evaluated

Site FAI-02045 is located on the point of an alluvial terrace approximately 2.5 km southwest of Dry Creek at UTM coordinates [REDACTED] (Figure 80, Figure 81). Site elevation is 214 masl. The site area overlooks the Tanana River Valley to the east. The point is approximately 40 m wide with 30°-35° slopes on the north, south and east sides. West of the landform, the terrain slopes down at 5°-10° to a two-track 80 m distant. The site area and adjacent slopes are thickly wooded, obstructing any significant viewshed. The nearest source of water is an unnamed seasonal creek approximately 1.3 km to the northwest.

The ecosystem is characterized as upland moist mixed needle/broadleaf forest (Figure 82). Site vegetation consists of mature aspen, mixed aged spruce and birch, and a few very large cottonwoods. The understory is alder, wild rose and low scrub, with a dense moss and lichen

ground cover. Surface exposure is 0%, except on the northern site border where exposed push piles are located.

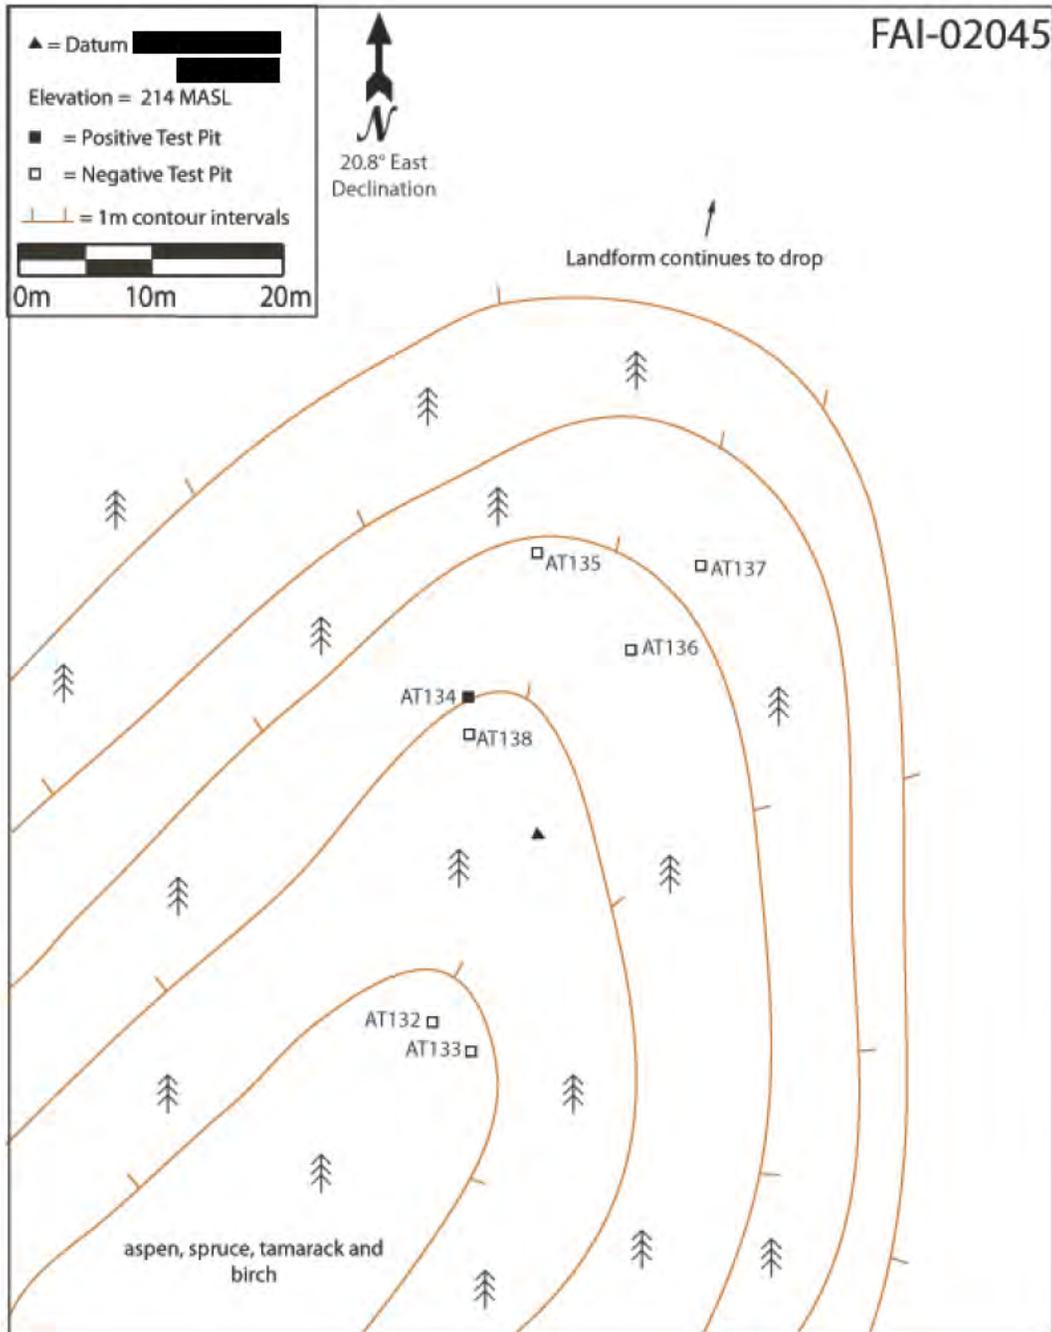

Figure 80. FAI-02045 sketch map

Figure 81. FAI-02045 aerial overview (view to south)

Site FAI-02045 was found through subsurface testing. Cultural material was recovered from one of the seven 50 cm x 50 cm test pits excavated. A total of five lithic artifacts were recovered at depths ranging from 5-30 cm BS (Table 9). No tools were recovered. Site stratigraphy consists of aeolian silts at least 50 cm thick overlying poorly-sorted silty gravels extending 50-60 cm BS (Figure 83).

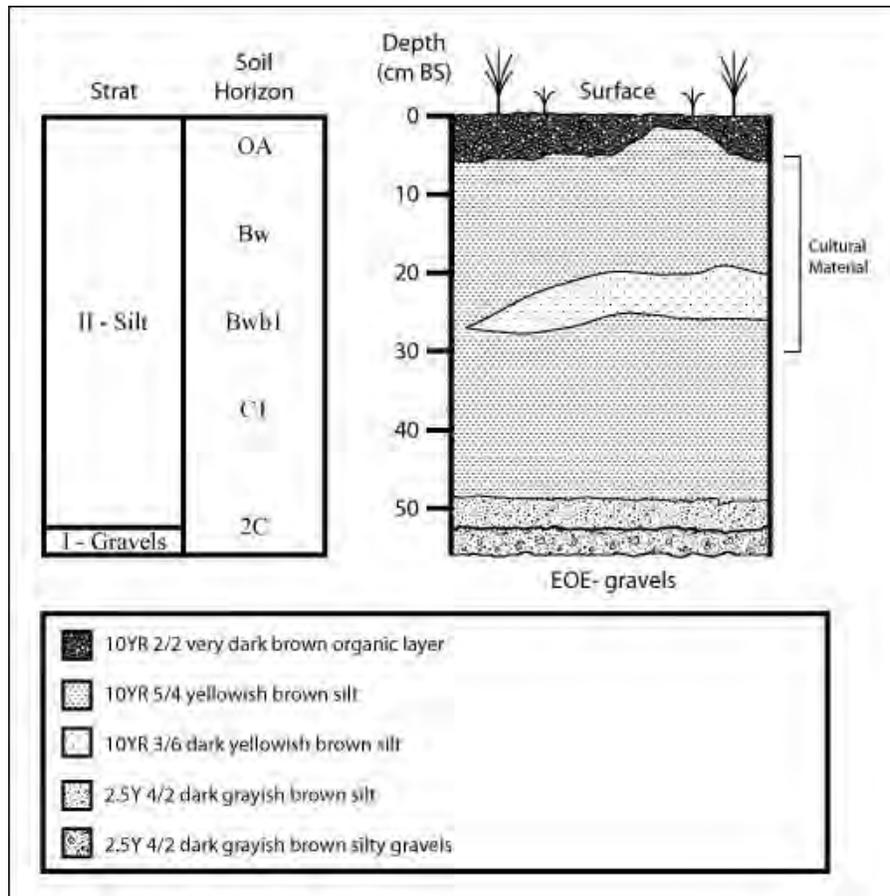

Figure 83. FAI-02045 stratigraphy

FAI-02046**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination:** Not Evaluated

Site FAI-02046 is located on a terrace edge at UTM coordinates [REDACTED] (Figure 84, Figure 85). Site elevation is 212 masl and has a view of the Tanana River Valley to the north. The site is situated on a narrow strip of level land 15 m north-south by 90 m east-west. It is bordered by a linear row of push piles to the south and the terrace edge to the north. A gravel two-track lies 5 m south of the push piles. The ground surface between the push piles and the two-track appears to have been mechanically scraped. North of the terrace edge, the terrain slopes down to the valley at approximately 20°.

The ecosystem is characterized as upland moist mixed needle/broadleaf forest (Figure 86). Site vegetation is sparse, mostly mixed aged aspen, spruce, and birch. The understory is alder, wild rose and low scrub, with a thin moss/lichen groundcover. Surface exposure is 0-10%.

Site FAI-02046 was found through subsurface testing. Cultural material was recovered from one of the seven 50 cm x 50 cm test pits excavated. A single very dark gray (3/N) basalt flake (UA2010-188), size class 10-20 mm, was recovered at 5-20 cm BS. No tools were found.

Site stratigraphy consists of aeolian silts 50-60 cm thick overlying poorly-sorted sandy gravels extending at least 65 cm BS (Figure 87, Figure 88).

Figure 84. FAI-02046 aerial overview (view to south)

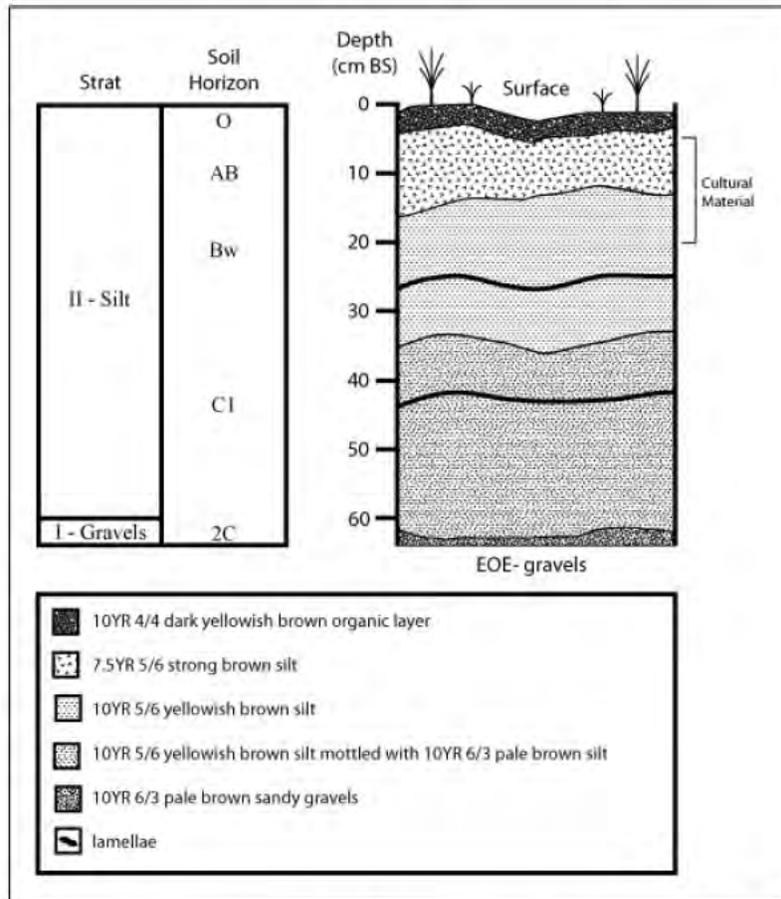

Figure 88. FAI-02046 stratigraphy

FAI-02047

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination: Eligible (See DOE form in Appendix 1)

Site FAI-02047 is located on a glacial outwash terraced bench at UTM coordinates [REDACTED] (Figure 89, Figure 90). Site elevation is 212 masl. The site is situated on a north-south terrace overlooking a substantial drainage to the west and the Tanana River Valley to the south and southeast. The terrace slopes gradually north-south and west-east at 0°-5°, with sharper slopes on its southern and western edges (15°-25°). The terrace is elevated approximately 10-12 m above both the drainage and the valley. A dirt two-track rises from the drainage and cuts across the site near the terrace's southern terminus.

The ecosystem is characterized as upland moist mixed needle/broadleaf forest (Figure 91). Site vegetation consists of mature aspen and mixed aged spruce and birch. The understory is alder, wild rose and low scrub, with a dense moss and lichen ground cover. Surface exposure across

the site is generally 0%, with the exception of the two-track road bed and shoulder, where surface visibility is 100%.

Site FAI-02047 was found through subsurface testing. Cultural material was recovered from four of the six 50 cm x 50 cm test pits excavated. A total of 13 lithic artifacts were recovered at depths ranging from surface to 65 cm BS (Table 10). A microblade medial fragment was recovered from one test pit at 60-65 cm BS (Table 10, Figure 92). Four calcined bone fragments were recovered from a test pit at depths ranging from 0-16 cm BS. All of these were small unidentifiable fragments less than 7 cm in diameter. Stratigraphic charcoal found in association with the cultural material produced an AMS ^{14}C date of 1430 ± 40 B.P. (Beta-283428).

Site stratigraphy consists of aeolian silts at least 50 cm thick overlying poorly sorted sandy gravels extending at least 75 cm BS (Figure 93, Figure 94).

FAI-02048**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02048 is located on a terrace edge approximately 2 km southwest of Dry Creek, at UTM coordinates [REDACTED] (Figure 95, Figure 96). Site elevation is 221 masl. The site is situated on a level area approximately 60 m north-south by 40 m east-west. The landform drops off to the north/northeast at a 15°-20° slope, and to the east at a 20°-30° slope. West and southwest of the site, the slope is a more gradual, 5°-10° slope for at least 50 m. The location of the site provides an unobstructed 80° viewshed north to southeast. Dry Creek is the nearest water source, and seasonally-wet drainages cut through the outwash bench in numerous, closer locations.

The ecosystem is characterized as upland dry mixed broadleaf and needleleaf forest (Figure 97). Site vegetation includes spruce, birch, aspen, willow, alder, and low forbs, with a dense moss/lichen groundcover. There is little to no surface exposure in the site area. The site appears to be undisturbed.

Site FAI-02048 was identified through subsurface testing. Cultural material was recovered from one of the twelve 50 cm x 50 cm test units excavated, which yielded one dark gray (4/N) chert flake fragment (UA2010-190), size class 10-20 mm, at 30-35 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silt 50-60 cm thick overlying poorly sorted silty gravel extending to at least 75 cm BS (Figure 98, Figure 99).

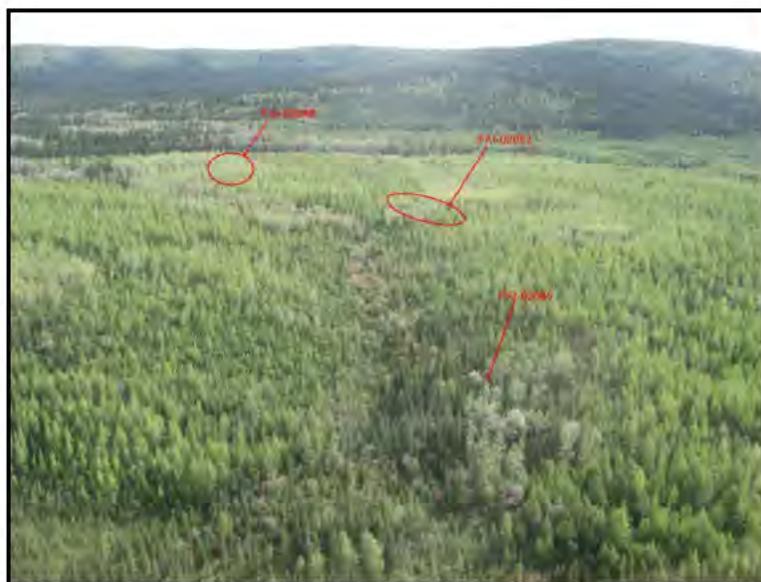

Figure 95. FAI-02048 aerial overview (view to south)

FAI-02049

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site FAI-02049 is located on a terrace edge approximately 2.5 km southwest of Dry Creek, at UTM coordinates [REDACTED] (Figure 100, Figure 101, Figure 102). Site elevation is 213 masl. The site is situated on a point on a north-facing terrace overlooking the Tanana River Valley. The slope down to the valley floor starts at approximately 5°-10°, dropping off to a 30°-40° slope near the bottom. The nearest source of water is Dry Creek, and seasonally-wet drainages cut through the outwash bench in numerous, closer locations.

The ecosystem is characterized as upland moist mixed broadleaf and needleleaf forest (Figure 101). Site vegetation consists of spruce, birch, aspen, willow, alder, and low shrubs. A dense

moss/lichen ground cover obscures any surface visibility. The site is disturbed by an abandoned two-track that runs north to south along the east side of the terrace.

Site FAI-02049 was identified through subsurface testing. Cultural material was recovered from one of the three 50 cm x 50 cm test units excavated. In total, two flakes were recovered from the site at depths 25-35 cm BS (Table 11). No tools were recovered from the site.

Site stratigraphy consists of aeolian silt 50-70 cm thick overlying poorly sorted, silty gravel extending to at least 90 cm BS (Figure 103, Figure 104).

FAI-02050**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination:** Not Evaluated

Site FAI-02050 is located on a terrace edge at UTM coordinates [REDACTED] (Figure 105, Figure 106). Site elevation is 215 masl. The site is situated on the summit of a round, flat-topped hill with an exceptional view of the Tanana River Valley and the Dry Creek drainage to the east. The summit is approximately 16 m in diameter, sloping down on all sides at 5°-15°. An unnamed, southwest-northeast trending creek lies at the base of the hill on the southeast side and is the closest source of water.

The ecosystem is characterized as upland broadleaf forest (Figure 107), and the site is primarily a homogenous young aspen forest with very little understory except for wild rose. Ground cover is mostly a thin layer of forest duff, and surface exposure is 5-10%.

Site FAI-02050 was found through subsurface testing. Cultural material was recovered from each of the three 50 cm x 50 cm test pits excavated. A total of 45 lithic artifacts were recovered at depths ranging from 0-125 cm BS (Table 12). One microblade medial fragment was recovered from one test pit at 60-65 cm BS (Table 12, Figure 108).

Site stratigraphy consists of aeolian silts at least 96 cm thick overlying fine sands extending to at least 150 cm BS (Figure 109, Figure 110).

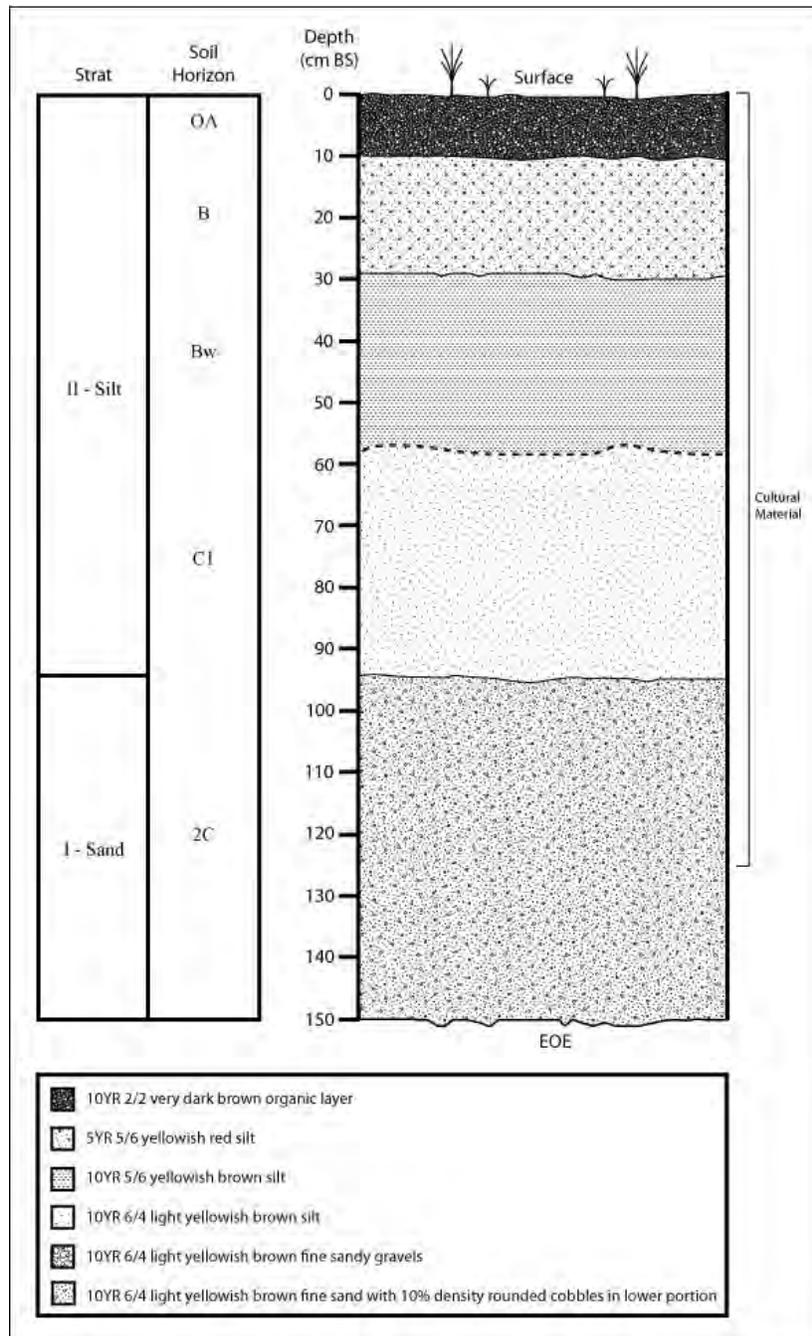

Figure 110. FAI-02050 stratigraphy

FAI-02051**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02051 is located on a terrace edge at UTM coordinates [REDACTED] [REDACTED] (Figure 111, Figure 112). Site elevation is 217 masl. The site is situated on a level hilltop overlooking a large drainage to the southeast and the Tanana River Valley to the north. The hilltop is relatively level and approximately 50-60 m in diameter. The sides of the hill slope down at 15°-30° to the north, east and south toward a lower terrace 15-20 m below. The west side of the hilltop remains fairly level for at least 50 m. An unnamed, southwest-northeast trending creek approximately 500 m southeast of the site is the closest source of water. The location provides excellent 180° views of the valley and the Dry Creek drainage to the north and east.

The ecosystem is characterized by upland dry broadleaf forest (Figure 113). Site vegetation consists of spruce, aspen, wild rose, Labrador tea, bearberry, salmonberry, and other low shrubs. Ground cover is a dense moss/lichen carpet. Surface visibility is 0%.

Site FAI-02051 was identified through subsurface testing. Cultural material was recovered from two of the four 50 cm x 50 cm test units excavated. Each of the positive test pits yielded a single rhyolite flake at depths ranging from 55-80 cm BS (Table 13). No tools were recovered from the site.

Site stratigraphy consists of aeolian silts 65-75 cm thick overlying poorly sorted silty gravels extending to at least 80 cm BS (Figure 114, Figure 115). AT187 contains a coarse sand and gravel layer (65-80 cm BS) below silty gravels (60-65 cm BS).

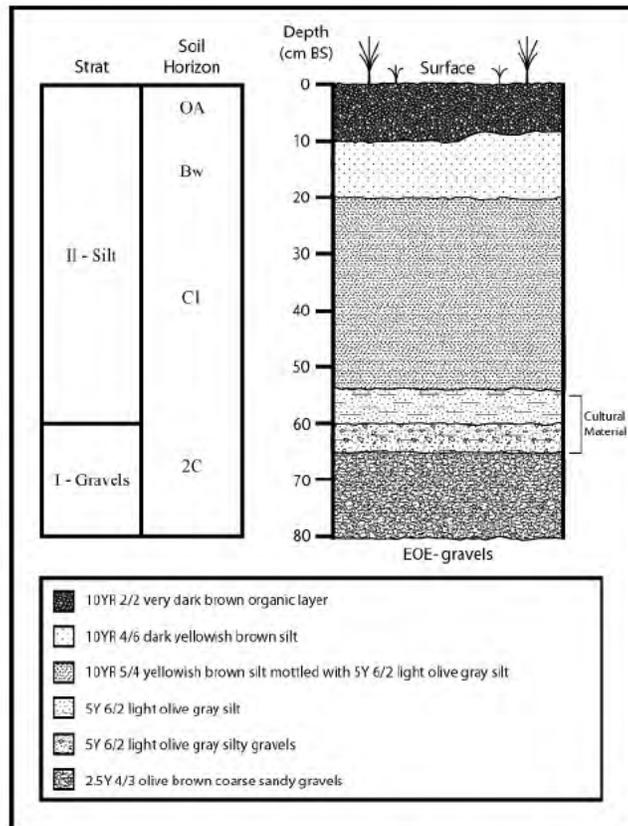

Figure 115. FAI-02051 stratigraphy

FAI-02052**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02052 is located on a terrace edge approximately 500 m west of Dry Creek at UTM coordinates [REDACTED] (Figure 116, Figure 117). Site elevation is 245 masl. The landform drops 15-20 m at a 50° slope to the east, north, and northeast. South of the site, the terrain gradually gains elevation for at least 50 m. A small, southwest-northeast drainage borders the site to the west. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations. The viewshed is approximately 120° with limited views of the Dry Creek drainage and the Tanana River Valley.

The ecosystem is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 118). Site vegetation consists primarily of mixed age spruce and birch with an understory of willow, alder, wild rose, low forbs, and a dense moss/lichen groundcover. Surface exposure is 0%. No disturbances were observed.

Site FAI-02052 was identified through subsurface testing. Cultural material was recovered from one of three 50 cm x 50 cm test units excavated. In total, two gray chert flakes were recovered from depths of 30-48 cm BS (Table 14). No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 30 cm thick overlying poorly sorted sandy gravel extending to at least 50 cm BS (Figure 119, Figure 120).

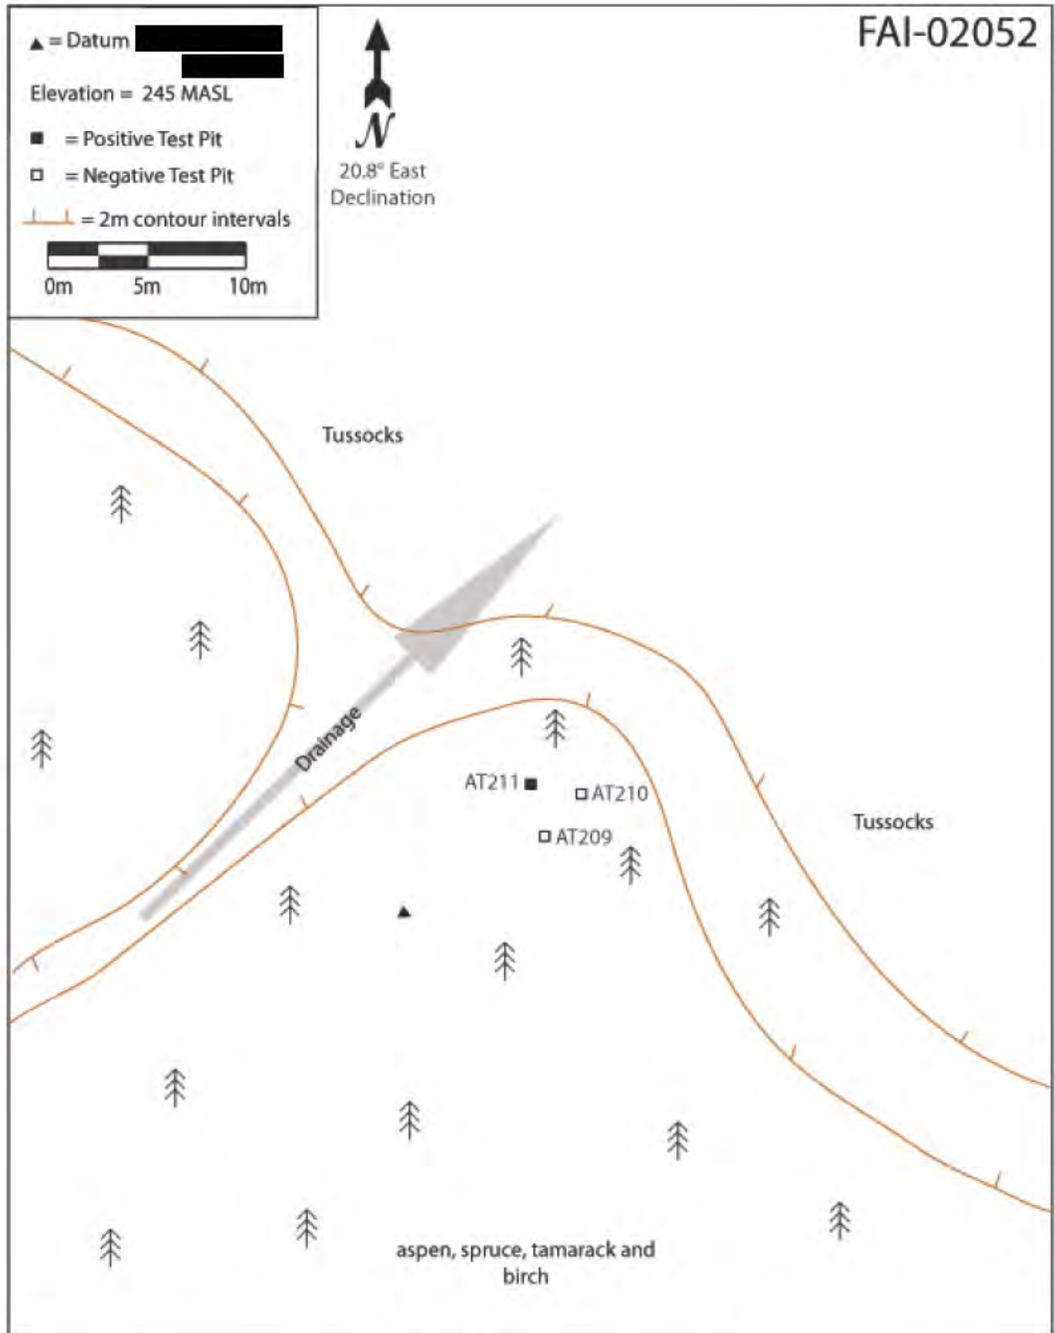

Figure 116. FAI-02052 sketch map

Figure 117. FAI-02052 aerial overview (view to west)

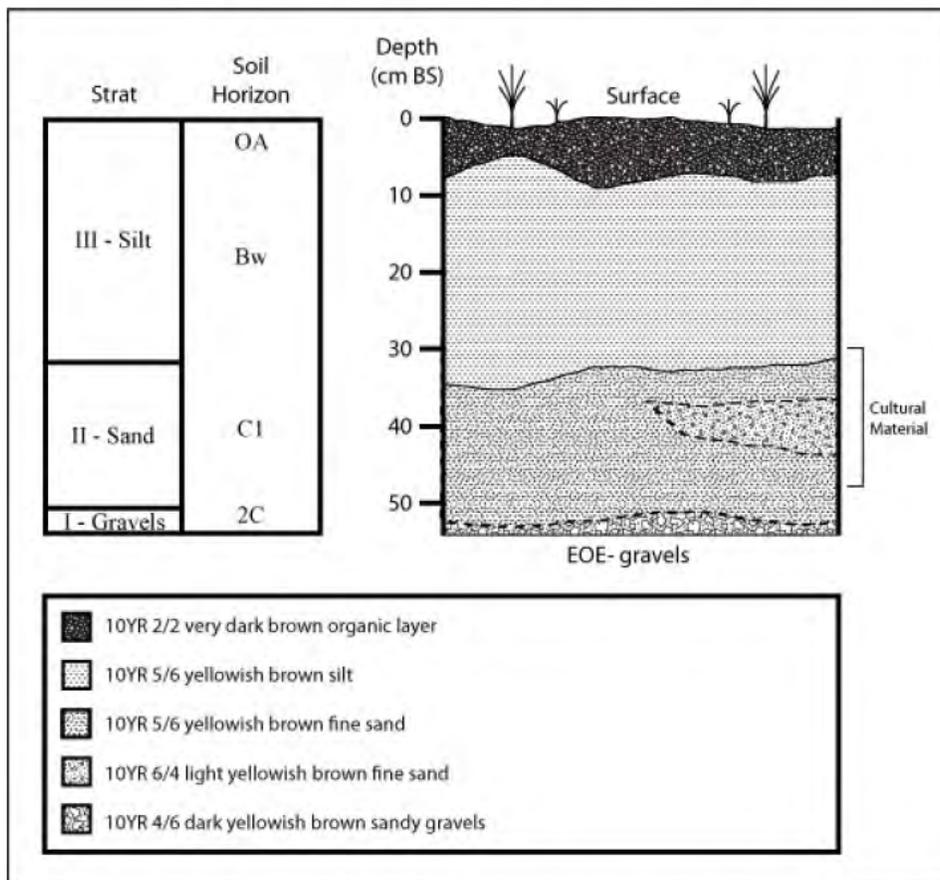

Figure 120. FAI-02052 stratigraphy

FAI-02053**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02053 is located on the edge of a north-facing terrace approximately 2.5 km southwest of Dry Creek at UTM coordinates [REDACTED] (Figure 121, Figure 122). Site elevation is 225 masl. The site area overlooks the Tanana River Valley to the north. The terrain slopes down north-east at 15°-20° and climbs at 0°-5° to a dirt two-track 80 m west and south of the site. Dense vegetation precludes any significant viewshed. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist mixed broadleaf and needleleaf forest (Figure 123). Site vegetation includes spruce, birch, aspen, low shrubs, mosses, and lichen. There is little to no surface exposed within or around the site area. The site area appears to be undisturbed.

Site FAI-02054 was identified through subsurface testing. Cultural material was recovered from one of the eight 50 cm x 50 cm test pits excavated. One test pit yielded a single translucent light greenish gray (10Y 7/1) rhyolite broken flake (UA2010-195), size class 10-20 mm, at 25-35 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 45 cm thick overlying poorly sorted sandy gravel extending to at least 85 cm BS (Figure 124, Figure 125).

Figure 121. FAI-02053 aerial overview (view to south)

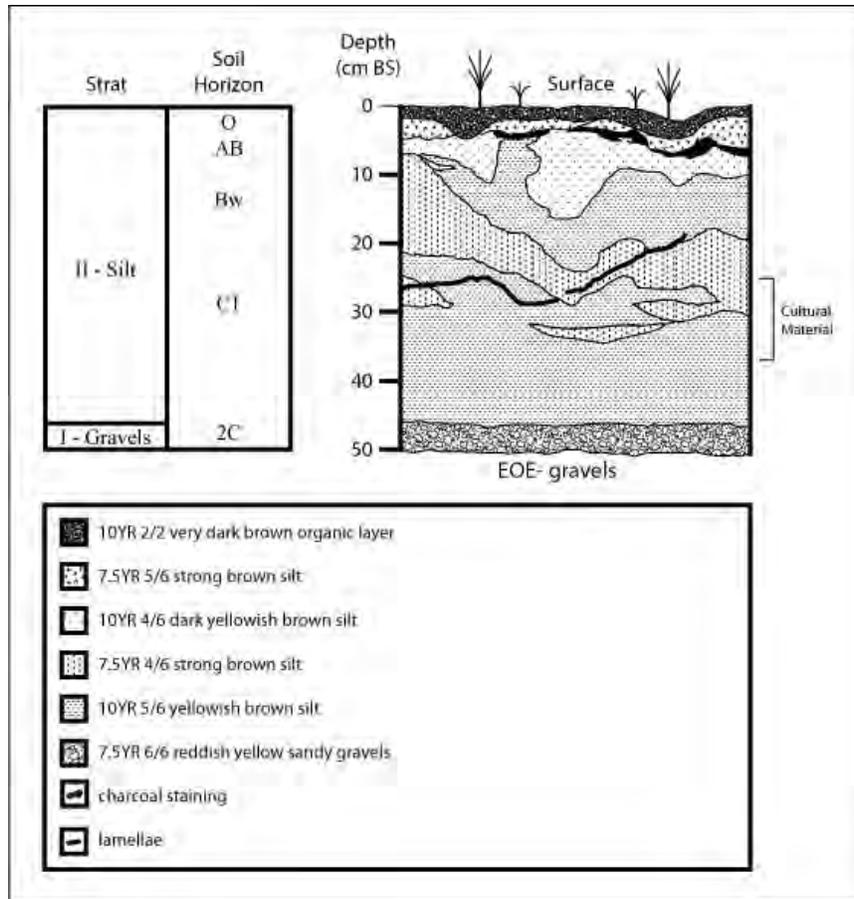

Figure 125. FAI-02053 stratigraphy

FAI-02054

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site FAI-02054 is located on a north-facing terrace edge approximately 3 km southwest of Dry Creek at UTM coordinates [REDACTED] (Figure 126, Figure 127). Site elevation is 210 masl. The site is situated on the edge of an east-west trending terrace perched 5 m above a lower, smaller terrace, some 15 m above a large, east-west dry drainage. The slope from site to drainage is 30°- 40°. A dirt two-track parallels the terrace approximately 30 m south of the site. The location provides a viewshed of the drainage northeast of the site. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist mixed needleleaf/broadleaf forest (Figure 128). Site vegetation includes spruce, birch, aspen, alder, willow, low scrub, mosses, and lichen.

Surface exposure is minimal, except in discrete areas where military foxholes and related activity areas have disturbed the site.

Site FAI-02054 was identified through subsurface testing. Cultural material was recovered from one of two 50 cm x 50 cm test pits, which yielded a single light brown (7.5Y 6/4) rhyolite flake fragment (UA2010-196), size class 20-30 mm, at 0-10 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 70 cm thick overlying silty sands and poorly sorted gravel extending to at least 80 cm BS (Figure 129, Figure 130).

Figure 126. FAI-02054 aerial overview (view to east)

FAI-02055

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site FAI-02055 is located on a north-facing terrace edge approximately 2.5 km southwest of Dry Creek at UTM coordinates [REDACTED] (Figure 131, Figure 132). Site elevation is 199 masl. The site is situated on an elevated rounded point extending roughly 10-20 m in diameter. The sides of the knoll slope down to a small drainage 50 m north and east of the site, steeper to the east than to the north. The location of the site provides a viewshed of a nearby drainage to the east and limited views of the Dry Creek drainage to the north/northeast. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations.

The ecosystem surrounding the site is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 133). Site vegetation includes spruce, birch, aspen, willow, alder, and low shrubs. Ground cover at the site is minimal, but some areas have up to 30% surface exposure. An abandoned military foxhole is located 5 m north of the site.

Site FAI-02055 was identified through subsurface testing. Cultural material was recovered from one of the two 50 cm x 50 cm test pits excavated, which yielded a single dark gray (2.5Y 4/1) chert broken flake (UA2010-197), size class 30-40 mm, at 0-5 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 75 cm thick overlying sandy silt and poorly sorted gravel extending to at least 80 cm BS (Figure 134, Figure 135).

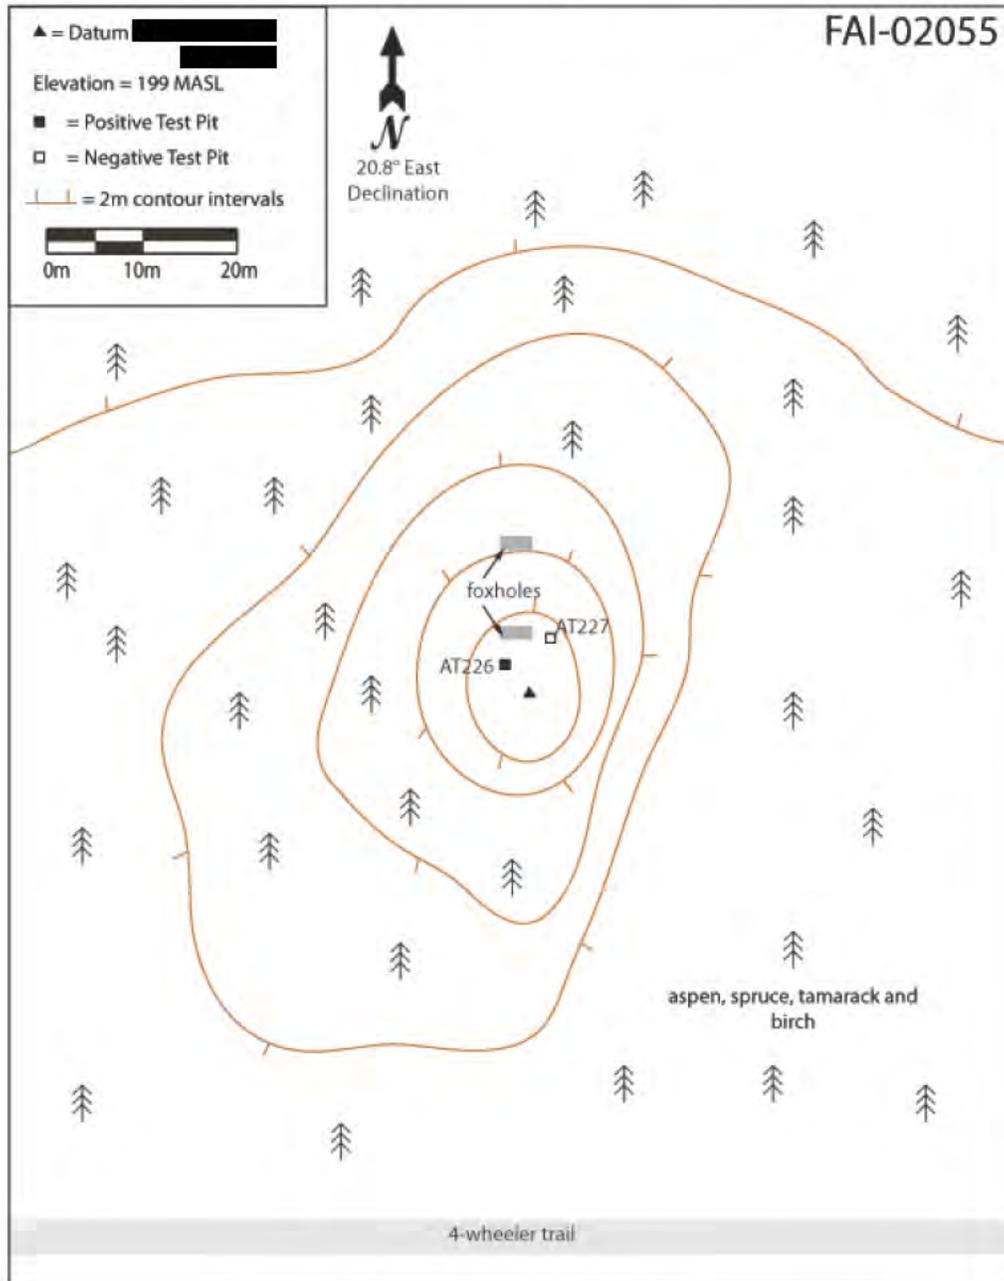

Figure 131. FAI-02055 sketch map

Figure 132. FAI-02055 aerial overview (view to south)

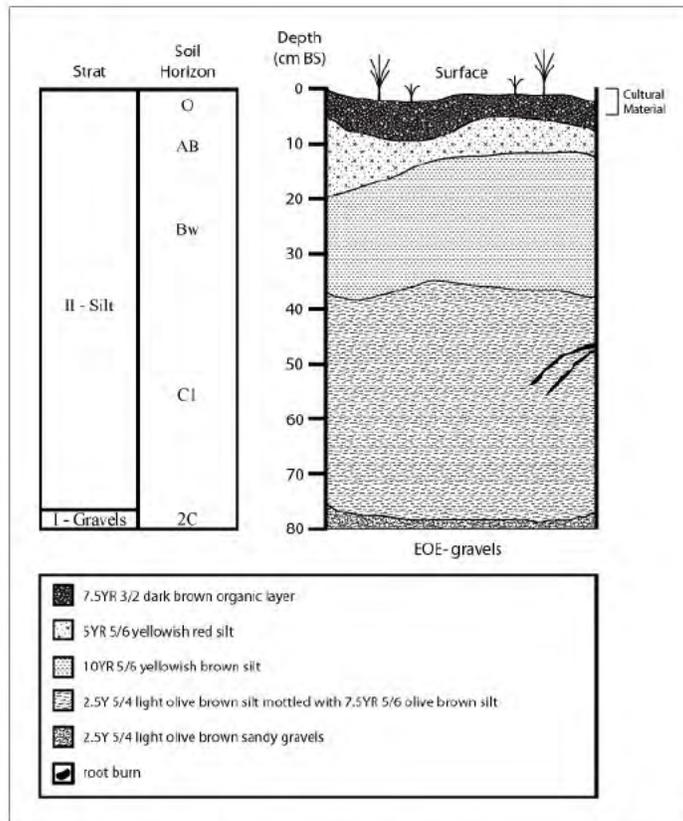

Figure 135. FAI-02055 stratigraphy

FAI-02056**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-2056 is located on a north-facing terrace edge some 2.5 km southwest of Dry Creek and less than 1 km east of the Clear Creek Assault Strip at UTM coordinates are [REDACTED] (Figure 136, Figure 137). Site elevation is 208 masl. The site is situated on a low east-west trending terrace edge bordered by two elevated terraces to the east and west. Fifteen meters north of the site, the terrain slopes gradually (0-5°) down to another terrace edge. South of the site, the terrain remains generally level for at least 50 m. The viewshed is significantly limited by vegetation and topography. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 138). Site vegetation includes mixed age spruce, birch, scrub alder, willow, mosses, and lichen. There is minimal surface exposure in the site area. The site appears to be undisturbed, although there are a number of military foxholes in the vicinity.

Site FAI-02056 was identified on the basis of a single dark reddish gray (10R 3/1) chert broken flake (UA2010-198), size class 20-30 mm, found within the exposed roots of a treefall (Figure 139). Soil in and around the roots was removed and screened, and 19 bone fragments were recovered. All of these are small fragments less than 10 cm in diameter. A single 50 cm x 50 cm test pit 15 m northeast of the treefall yielded no cultural material.

Site stratigraphy consists of aeolian silt 48 cm thick overlying poorly sorted, sandy silt and gravel extending to a depth of 50 cm BS (Figure 139).

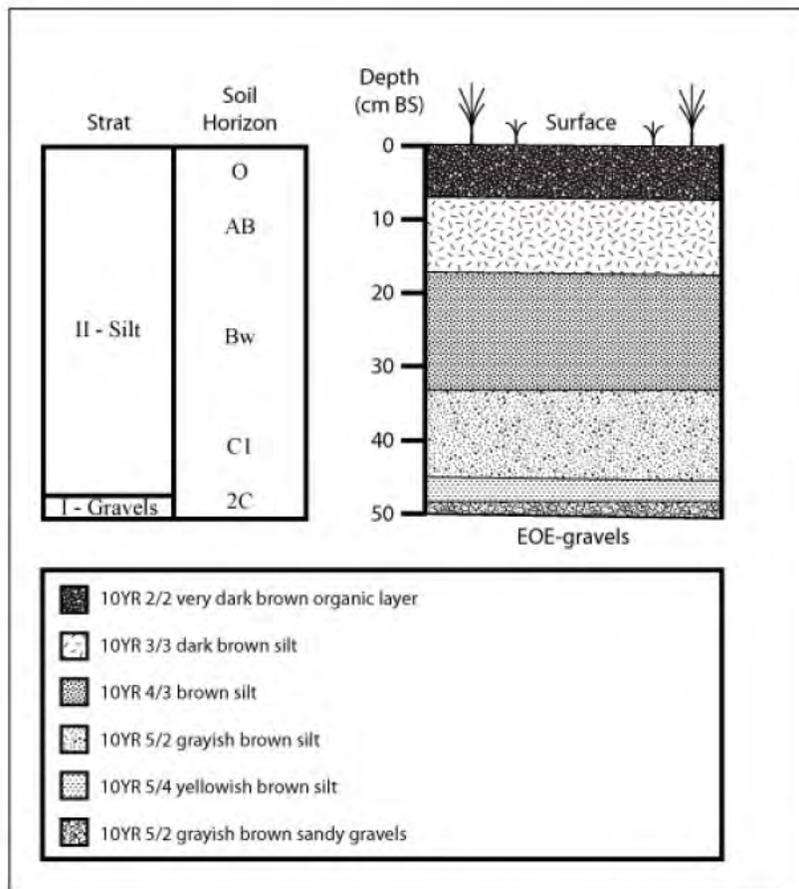

Figure 139. FAI-02056 stratigraphy (note: depth of cultural material is unknown)

FAI-02057**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02057 is located on a north-facing terrace edge approximately 3 km southwest of Dry Creek at UTM coordinates [REDACTED] (Figure 140, Figure 141). Site elevation is 215 masl. The site is situated on an elongated point that protrudes from the terrace and is situated between two north-south drainages. The site overlooks a large dry drainage running east-west, 30-40 m north of the site. The terrain surrounding the site slopes down north, east, and west at approximately 5°-10° to a secondary, lower terrace. Below this terrace, the slope increases to 10°-15° until it terminates in the drainages. South of the site, the terrain slopes gradually uphill for at least 50 m. The viewshed is limited to the dry drainage to the north. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist mixed broadleaf and needleleaf forest (Figure 142). Site vegetation includes spruce, birch, aspen, willow, alder, and low scrub. Surface exposure ranges from 0-30%. The site area is disturbed by two military foxholes and is littered by a can scatter and other military-related debris.

Site FAI-02054 was identified through subsurface testing. Cultural material was recovered from one of four 50 cm x 50 cm test units, which yielded a single gray (7.5YR 5/1) chert flake fragment (UA2010-199), size class 10-20 mm, at 20-25 cm BS. No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 50 cm thick overlying poorly sorted, silty gravel and/or sandy silt and gravel extending to at least 65 cm BS (Figure 143, Figure 144).

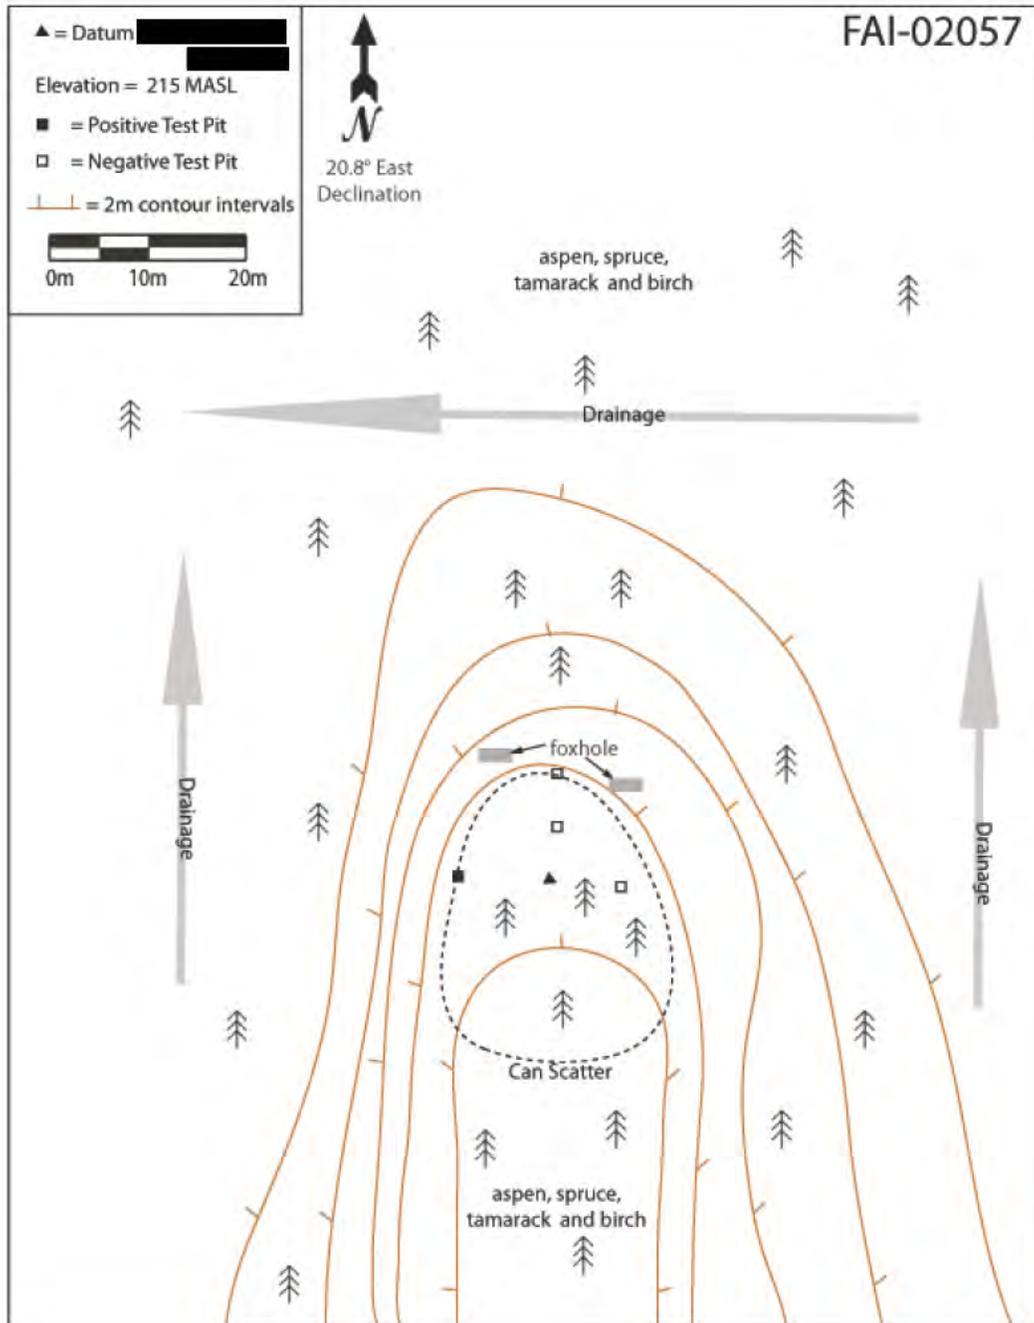

Figure 140. FAI-02057 sketch map

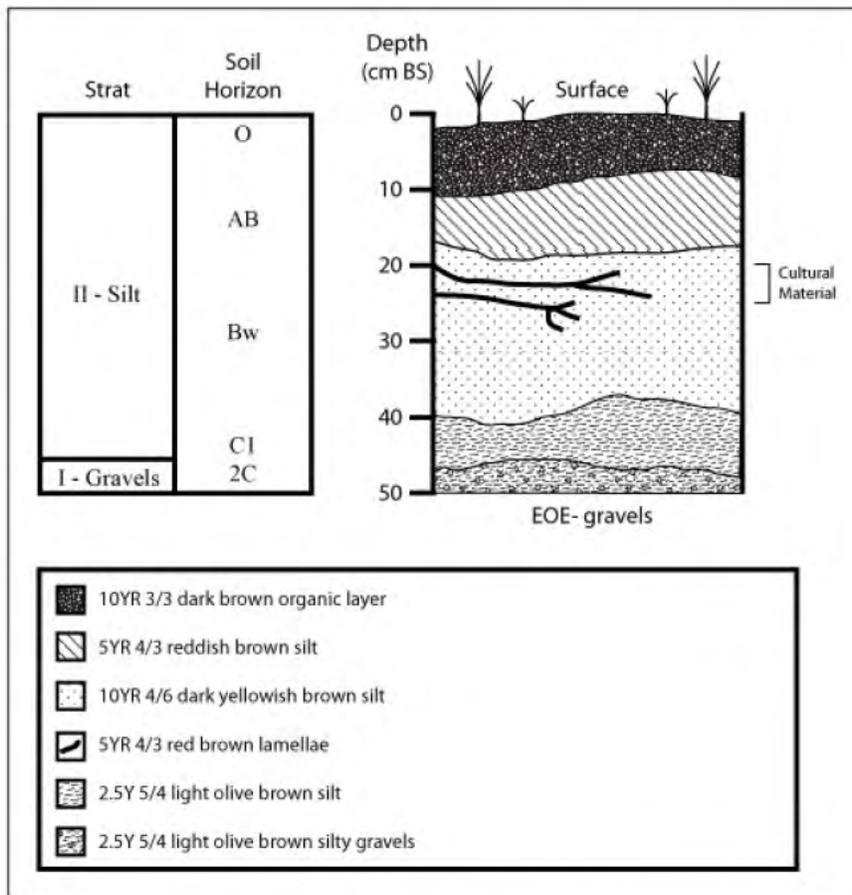

Figure 144. FAI-02057 stratigraphy

FAI-02058**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination:** Not Evaluated

Site FAI-02058 is located on the second of three stepped terraces overlooking a large, south-north drainage to the east and the Tanana River floodplain to the north (Figure 145, Figure 146). Site UTM coordinates are [REDACTED]. Site elevation is 200 masl. The site is located on the northern terminus of the small level terrace approximately 10-15 m in width. East of the terrace edge, the terrain slopes down at approximately 15° to a smaller, lower terrace, then at a 7-8° slope to the drainage bottom. Forty meters west of the site and 10 m higher is a larger terrace, site location of FAI-02059. The Flag Hill Radio Tower is visible on the skyline to the southeast at 120°.

The ecosystem is characterized as upland moist mixed needleleaf (Figure 147). The terrace is thickly wooded with small spruce trees except on the terrace edge, where the ground surface is bare dirt and gravel, void of any ground cover and prone to erosion. Site vegetation is primarily low thick spruce trees with a sparse understory of alder, willow, mosses, and lichen. Dry Creek is the nearest water source, although several unnamed seasonal creeks cut through the outwash bench at closer locations.

Site FAI-02058 was found through subsurface testing. Cultural material was recovered from a single 50 cm x 50 cm test pit excavated. A total of five lithic artifacts were recovered at depths ranging from 0-10 cm BS, one of which is a single flake found on the surface of the eroding slope immediately below the terrace edge (Table 15). Tools recovered consist of a single microblade medial fragment (Table 16, Figure 148).

Site stratigraphy consists of aeolian silts at least 10 cm thick overlying at least 45 cm of compact aeolian silts that contain numerous 1-3 cm thick, lamellae-like bands. Small rounded gravels are present from 10 cm BS to at least 45 cm BS (Figure 149, Figure 150).

FAI-02059**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02059 is located on the upper of three stepped terraces overlooking a large, south-north drainage to the east and the Tanana River Valley to the north (Figure 151, Figure 152). UTM coordinates for the site are [REDACTED]. Site elevation is 202 masl. The site is situated on a level area near the eastern edge of the terrace. The terrace drops at a 5°-15° slope to the north, east, and west. South of the site, the terrace roughly parallels the eastern drainage at a slightly lower elevation. The location of the site provides an excellent viewshed of the eastern drainage and the Tanana River Valley to the north. Dry Creek is the nearest water source, although several unnamed seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist mixed needleleaf forest (Figure 153). The terrace is thickly wooded with small spruce trees except on the terrace edge, where the ground surface is bare dirt and gravel, void of any ground cover and prone to erosion. Site vegetation is primarily low thick spruce trees with a sparse understory of alder, willow, mosses, and lichen.

Site FAI-02059 was located through subsurface testing. Cultural material was recovered from one of three 50 cm x 50 cm test units excavated. In total, 42 artifacts were recovered at depths of 0-45 cm BS. These artifacts include 39 pieces of debitage (Table 17), two biface fragments (Table 18, Figure 154), one complete endscraper (Table 19, Figure 155), and one tested cobble (Table 20).

Site stratigraphy consists of aeolian silts at least 70 cm thick containing intermittent bands and pockets of sand, overlying poorly sorted silty gravels extending to at least 80 cm BS (Figure 156, Figure 157).

FAI-02060**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination:** Eligible (See DOE form in Appendix 1)

Site FAI-02060 is located on a north-facing terrace edge at UTM coordinates are [REDACTED] [REDACTED] (Figure 158, Figure 159, Figure 160). Site elevation is 198 masl. The site is situated in the northwest corner of the elevated terrace overlooking a north-south drainage to the west and the Tanana River Valley to the north. The terrace is approximately 10-12 m above the drainage and the valley; a 15° slope leads down to both. East and southeast of the site, the terrain gradually slopes up to the crest of the landform 45 m east of the site datum. The terrace provides an excellent viewshed of the Tanana River Valley and the Dry Creek drainage to the north. Dry Creek is the nearest water source, and several unnamed seasonal creeks cut through the outwash bench at closer locations.

The ecosystem is characterized as upland moist needleleaf forest. Site vegetation consists of dense low spruce thickets, mature aspen, and mixed-aged birch. The understory is alder, willow, wild rose, and low scrub, with a dense moss and lichen ground cover. Surface exposure is 0%.

Site FAI-02060 was initially identified by a single retouched flake found on the surface near the western terrace edge (Table 21, Figure 161). Subsequent subsurface excavations produced cultural material from all four 50 cm x 50 cm test pits excavated. A total of 34 lithic artifacts were recovered from test pits at depths ranging from 0-37 cm BS (Table 22).

Dispersed charcoal associated with cultural material at 29 cm BS produced an AMS ¹⁴C date of 8130 ± 40 (Beta-283429).

Site stratigraphy consists of aeolian silts 45-55 cm thick overlying a thick gravel layer extending to at least 65 cm BS (Figure 162, Figure 163).

FAI-02061

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site FAI-02061 is located on a north-facing terrace edge roughly 2.5 km southwest of Dry Creek—which is the closest water source—at UTM coordinates are [REDACTED] [REDACTED] (Figure 164, Figure 165). Site elevation is 200 masl. The site is situated on a point separated from the greater terrace by two drainages. The site is fairly level, but the terrain drops to the east at a 20° slope. North and south of the site, the terrain slopes more gradually down to the smaller drainages. The viewshed is minimal, limited by the surrounding topography.

The ecosystem is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 166). Site vegetation includes spruce, birch, aspen and low shrubs, with a dense moss/lichen groundcover. Surface exposure is minimal, except for an exposed, non-vegetated military foxhole at the northern site perimeter.

Site FAI-02061 was identified through subsurface testing. Cultural material was recovered from one of four 50 cm x 50 cm test pits excavated. In total, two rhyolite flakes were recovered from depths of 25-30 cm BS (Table 23). No tools were recovered from the site.

Site stratigraphy consists of aeolian silt at least 70cm thick overlying sandy silt and poorly sorted gravels extending to at least 85 cm BS (Figure 167).

Figure 163. FAI-02061 aerial overview (view to south)

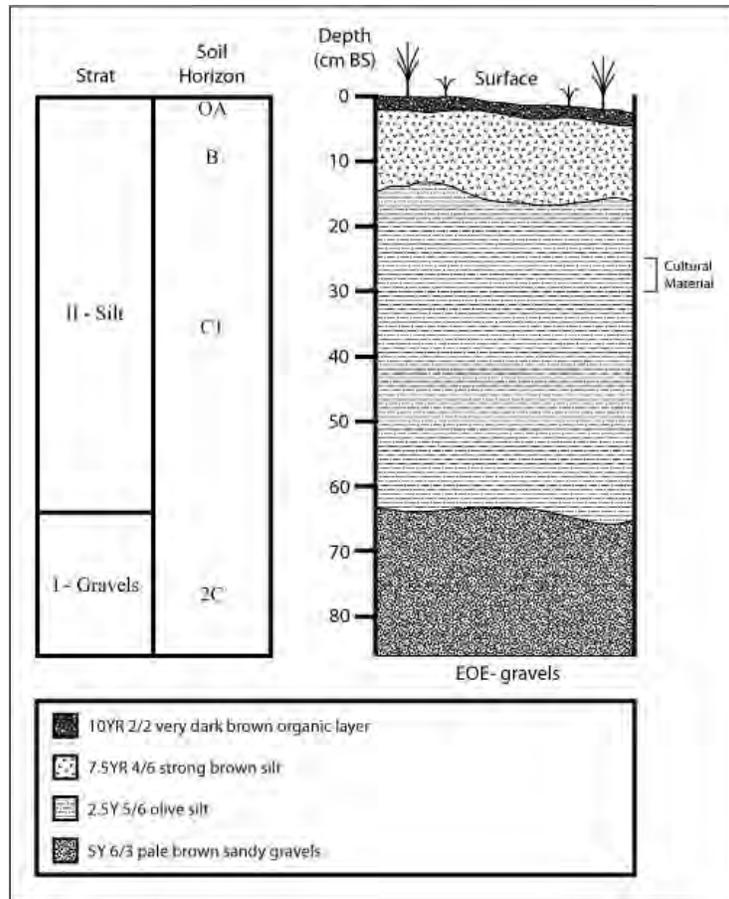

Figure 166. FAI-02061 stratigraphy

FAI-02062

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site FAI-02062 is located on a north-facing terrace edge approximately 3 km southwest of Dry Creek and about 1 km southeast of the Clear Creek Assault Strip at UTM coordinates [REDACTED] (Figure 168, Figure 169). Site elevation is 202 masl. The site is situated on small, level knoll 2-4 m in diameter overlooking a south-north drainage lying to the east. The site area has a 0°-5° slope. The sides of the knoll slope down 15°-20° in all directions. The location of the site provides an excellent 180° viewshed of a large drainage to the east and a limited view of the Tanana River Valley to the north.

The ecosystem surrounding the site is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 170). Site vegetation consists of spruce, birch, aspen, willow, alder, and low

shrubs. The site itself is mostly bare ground with a few low shrubs. The ecosystem in the drainage below the site is characterized by lowland tussock scrub bog, and this is the nearest source of water. The site is disturbed by a modern campsite.

Site FAI-02062 was identified through subsurface testing. Cultural material was recovered from a single 50 cm x 50 cm test pit excavated. Two chert flakes were recovered at a depth of 0-10 cm BS (Table 24). No tools were recovered from the site.

Site stratigraphy consists of aeolian silts at least 37cm thick overlying poorly sorted sandy gravel extending to at least 45 cm BS (Figure 171, Figure 172).

FAI-02063

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Eligible (See DOE form in Appendix 1)

Site FAI-02063 is located on a north-south trending terrace edge approximately 1.5 km east-northeast of Blair Lake North (Figure 173, Figure 174). UTM coordinates are [REDACTED]. Site elevation is 273 masl. The terrace is elevated approximately 25 m above Dry Creek, which is the nearest source of water. The eastern terrace drops down to Dry Creek at approximately 40°. The slope to the west is much more gradual, 5-10°, but continues for at least 60 m. The site sits at a point on the terrace edge that protrudes 2-3 m to the east. This point provides a 180° view of Tanana Flats below. Pork Chop Lake can be seen directly east, approximately 2 km away.

The ecosystem is characterized as upland moist mixed broadleaf/needleleaf forest (Figure 175). The vegetation consists of spruce, aspen, rose, bearberry, low scrub, moss and lichen. The surface exposure is on average 50% with visibility higher near the eroding terrace edge.

Site FAI-02063 was found through subsurface testing. Three 50 cm x 50 cm shovel tests were excavated, one of which contained cultural material. Cultural material was recovered from 35-60 cm BS. The site consists of 11 chert flakes (Table 25) and one broken chert projectile point (Table 26, Figure 176). The flakes were dispersed from 35-60 cm BS, and the projectile point was recovered from 50-55 cm BS.

Site stratigraphy consists of aeolian silts and sands at least 44 cm thick overlying basal poorly sorted sandy gravels (Figure 177, Figure 178).

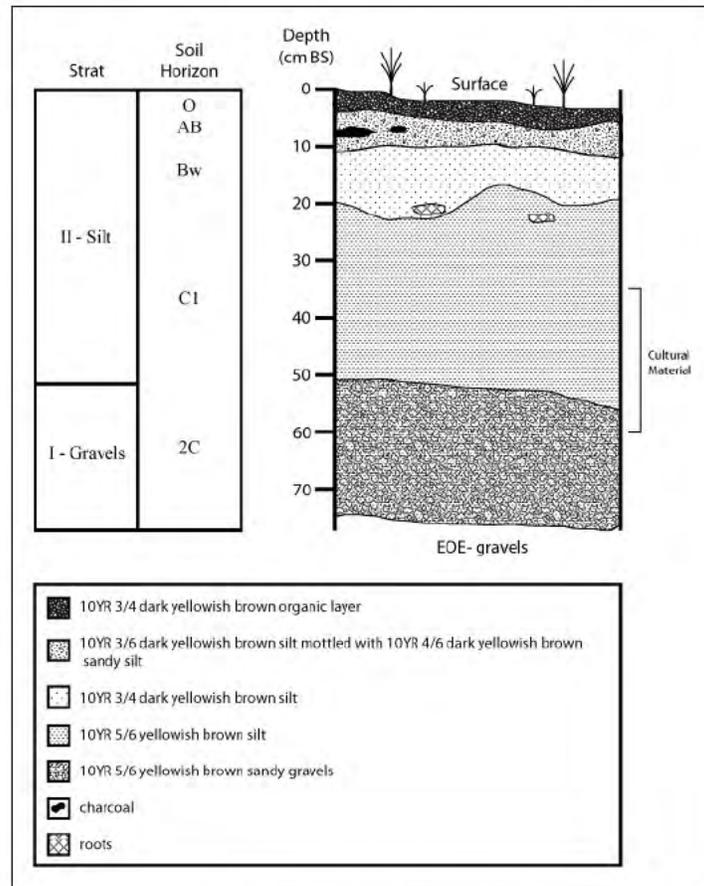

Figure 177. FAI-02063 stratigraphy

FAI-02064**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Eligible (See DOE form in Appendix 1)

Site FAI-02064 is located on the crest of a bedrock knoll north of Blair Lakes (Figure 179, Figure 180) at UTM coordinates [REDACTED]. Site elevation is 351 masl. The view from the crest is 360°. Blair Lake North, the closest source of water, can be seen approximately 500 m to the southeast. The slopes to the northeast and southwest are approximately 30°, and the slopes to the northwest and southeast are approximately 15°. The highest point of the crest (approximately 40 m northwest-southeast by 15 m northeast-southwest) has been mechanically scraped. Push piles line the southern edge of the disturbance.

The ecosystem is characterized as upland dry needleleaf/broadleaf forest (Figure 181). Vegetation consists of mature aspen and spruce with an understory of fireweed, rose, low bush cranberry, moss, and lichen. Surface visibility is 0-10%.

Site FAI-02064 was found through subsurface testing. Five 50 cm by 50 cm test pits were excavated. Two test pits contained cultural material consisting of 70 lithic flakes 0-45 cm BS (Table 27), two microblades at 10-33 cm BS (Table 28; Figure 182) and one burin spall at 35 cm BS (Table 29, Figure 183).

Dispersed charcoal found in association with cultural material at 40 cm BS produced an AMS ¹⁴C date of 2170 ± 40 (Beta- 283435).

Site stratigraphy consists of aeolian silts at least 38 cm thick overlying decaying schist bedrock (Figure 184, Figure 185).

FAI-02065

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02065 is located on the edge of a north-facing terrace at UTM coordinates are [REDACTED] (Figure 186, Figure 187). Site elevation is 208 masl. The landform overlooks the Tanana Flats to the north and northwest and a 100 m wide drainage channel to the east and southeast. The terrace edge slopes roughly 45° to the tussocks approximately 15 m below. The terrace edge extends roughly 120 m to the west, where FAI-02066 was discovered. The viewshed from the site is approximately 270° with open views of the Fairbanks hills to the northeast, Clear Creek Buttes approximately 25 km to the northwest at 325°, and the outline of Dry Creek approximately 3 km to the north. There are numerous water sources in the vicinity of the site including multiple creeks, the nearest of which flows north-south through the drainage channel 50 m to the east.

The ecosystem is characterized as upland needleleaf forest (Figure 188). Vegetation is comprised of spruce, tamarack, aspen and willow with an understory of forbs, low-bush cranberries, moss and lichen. Surface exposure on the eroding terrace edge is 90-100% due to wind, water, and bioturbation (animal burrows). Exposure drops to 10-20% a few meters from the edge. FAI-02070 is located on the same landform approximately 50 m to the south of FAI-02065.

Site FAI-02065 was identified on the basis of six flakes (Table 30) and one unifacial tool (Table 31, Figure 189) found on the surface. No test pits were excavated and no stratigraphic information was collected; however, FAI-02066 is approximately 120 m west on the same landform and likely has similar stratigraphy.

FAI-02066

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site FAI-02066 is located on a north-facing terrace edge, on a point formed by a narrow channel that dissects the landform (Figure 190, Figure 191). UTM coordinates are [REDACTED]. Site elevation is 212 masl. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below and approximately 45° to the northwest into the drainage channel 10-15 m below. FAI-02065 is located roughly 120 m east of this site on the same landform. FAI-02067 is located to the west on the opposite side of the drainage channel. The nearest water source is a drainage creek which flows north-south approximately 170 m east of the site.

The location would offer roughly a 250° view; however, thick vegetation in the form of upland moist mixed broadleaf/needleleaf forest obscures the viewshed (Figure 192). The vegetation is comprised of spruce, aspen, tamarack, and birch with an understory of forbs, grasses, fireweed, low-bush cranberry, moss, and lichen. No disturbances were observed. Surface exposure is 5%.

The site was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated, three of which contained cultural material. Eighty-seven lithic flakes were recovered from 0-33

cm BS (Table 32). Two re-fitting heat-fractured biface fragments were recovered from one test pit with one found in situ at 9 cm BS (Table 33, Figure 193). The other fragment was recovered between 0-30 cm BS. One black chert microblade proximal fragment was found in a test pit at 0-33 cm BS (Table 34, Figure 194).

Site stratigraphy consists of aeolian silts and sands at least 75 cm thick overlying basal poorly sorted sandy gravels (Figure 195, Figure 196).

FAI-02067**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02067 is located on a finger on a north-facing terrace edge (Figure 197, Figure 198). UTM coordinates are [REDACTED]. Site elevation is 212 masl. The local landform protrudes to the northeast approximately 15 m above the Tanana Flats. The landform extends at least 60 m to the south. The northeast corner offers a 270° viewshed. The Fairbanks hills can easily be seen to the northeast. Clear Creek Buttes can be seen roughly 25 km to the northwest at 325°. The outline of Dry Creek can be seen approximately 3 km to the north. FAI-02066 is located roughly 45 m to the east on the opposite side of an unnamed adjacent drainage channel. FAI-02078 is located roughly 45 m to the west on the opposite side of an unnamed adjacent drainage channel.

The ecotype is characterized as upland broadleaf/needleleaf forest (Figure 199). Vegetation consists of spruce, birch, aspen, and tamarack, with an understory of alder, grass, forbs, and moss. No disturbances were observed. Surface exposure is 5%.

Site FAI-02067 was found through subsurface testing. One 50 cm x 50 cm test pit was excavated and produced cultural material. Seven flakes (Table 35) were recovered from 0-40 cm BS.

Site stratigraphy consists of aeolian silts 69 cm thick overlying basal poorly sorted silty gravels (Figure 200, Figure 201).

FAI-02068

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not determined

Site FAI-02068 is located on the edge of a north-facing terrace (Figure 202, 203). UTM coordinates are [REDACTED]. Site elevation is 200 masl. The terrace is elevated approximately 15 m above the tussocks below. The landform slopes down at roughly 40° the west, north and east sides. The location provides commanding views of Clear Creek Buttes to the northwest at 327°, the hills of Fairbanks to the northeast, and the outline of Dry Creek approximately 3 km to the north. The northwest and northeast corners of the landform offer 270° views of the Tanana Flats. An elevated knob on the southeast side of the landform offers a 300° view of the Tanana Flats and the drainage channel to the east. The closest water source is a drainage creek that flows north-south through the wide drainage channel roughly 75 m to the east.

The surrounding ecotype is characterized as upland low and tall scrub (Figure 204). Vegetation in the area consists of immature spruce, alder, aspen, and birch with an understory of moss and lichen. Surface exposure on the edge of the landform is 100% due to wind and water erosion and bioturbation (animal burrows). Site disturbance is moderate, but all disturbances are natural.

Site FAI-02068 was found through subsurface testing. Eight 50 cm x 50 cm test pits were excavated. Two test pits contained cultural material. Thirty-four chert flakes were dispersed from 0-30 cm BS (Table 36). One unidentifiable bone fragment was collected from 100-110 cm BS.

Site stratigraphy consists of aeolian silts at least 58 cm thick overlying poorly sorted basal silty gravels (Figure 205, Figure 206).

FAI-02069

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02069 is located on the northeast corner of a point formed where an unnamed drainage dissects a north-facing terrace edge (Figure 207, Figure 208). UTM coordinates are [REDACTED]. Site elevation is 209 masl. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below and approximately 45° to the east into the drainage channel 10-15 m below. FAI-02078 is located roughly 40 m to the east on the opposite side of the drainage channel. Without foliage present, the viewshed offers roughly 270° of unobstructed sight. The hills of Fairbanks can be seen to the northeast, Clear Creek Buttes are approximately 25 km away to the northwest at 325°, and the outline of Dry Creek is approximately 3 km to the north. The nearest water source is a drainage creek that runs north-south approximately 300 m east of the site.

The ecotype is characterized as an upland mixed broadleaf/needleleaf forest (Figure 209). The vegetation is comprised of spruce, aspen, tamarack, and birch with an understory of forbs, grasses, fireweed, low bush cranberries, moss, and lichen. Minimal to no disturbances were observed. Surface exposure is 5%.

Site FAI-02069 was found through subsurface testing. Five 50 cm by 50 cm test pits were excavated. One test pit contained cultural material, including one brown (7.5YR 5/4) 7.5-10 mm chert flake fragment (UA2010-211) collected from 0-30 cm BS.

Site stratigraphy consists of aeolian silts at least 68 cm thick overlying poorly sorted silty gravels (Figure 210, Figure 211).

Figure 206. FAI-02069 aerial overview (view to south)

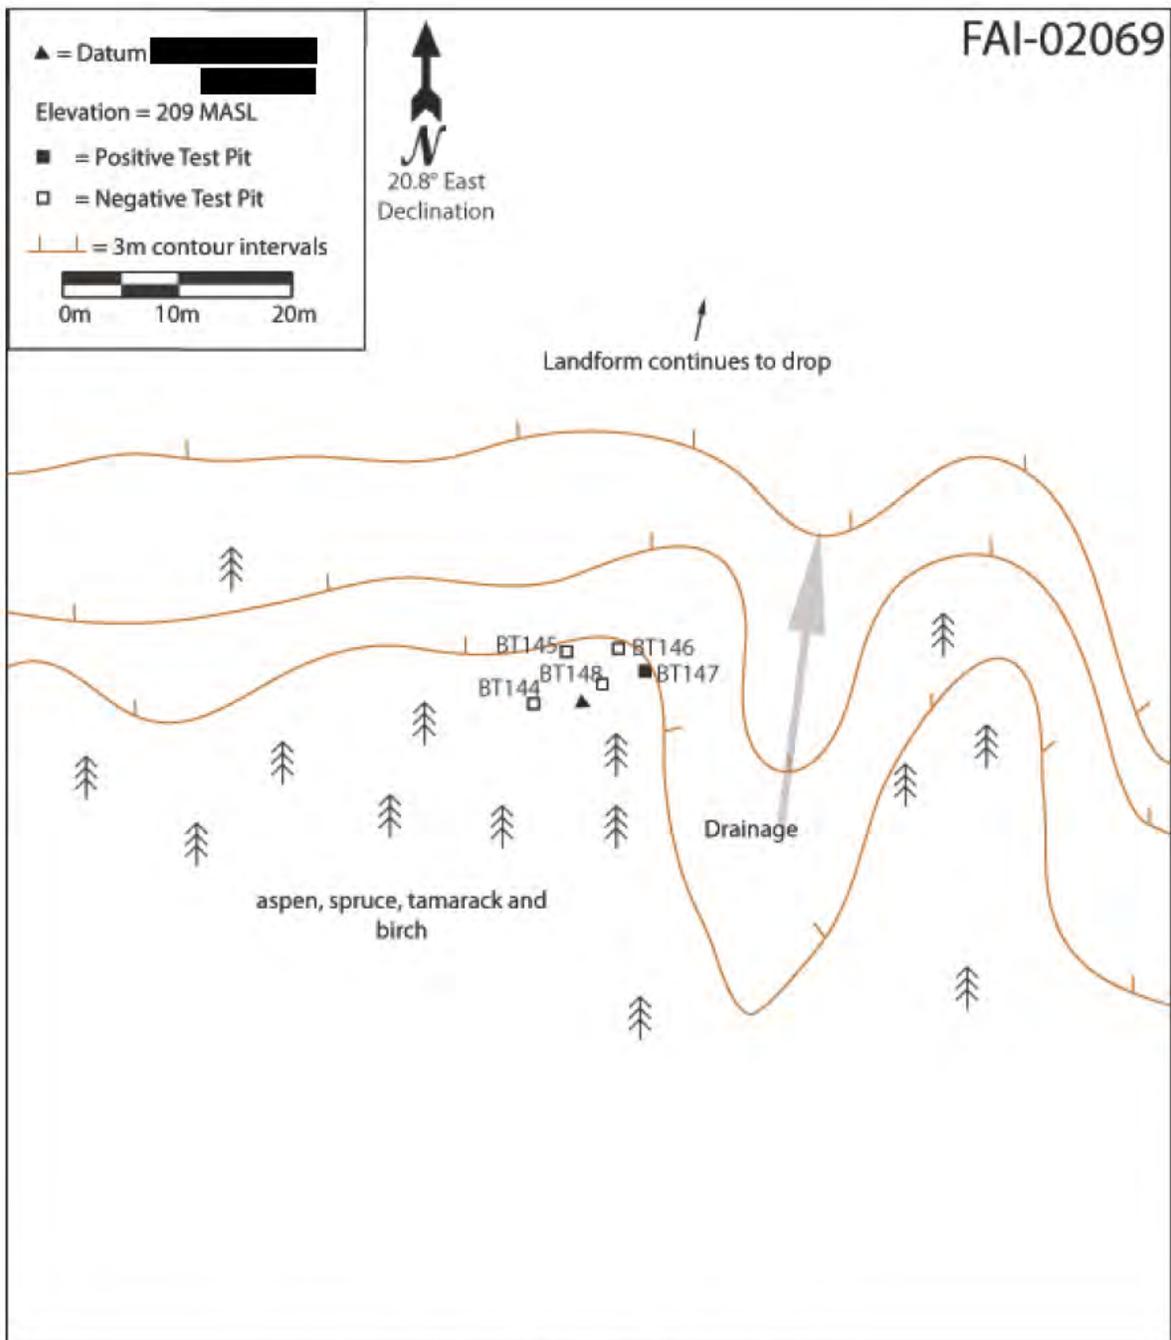

Figure 207. FAI-02069 sketch map

FAI-02070

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Determined

Site FAI-02070 is located on a point on a north-facing terrace edge (Figure 212, Figure 213). UTM coordinates are [REDACTED]. Site elevation is 212 masl. The eastern edge of the landform slopes down at roughly 50° to tussocks below. The southern point site area offers a 270° view of the surrounding terrain. FAI-02073 can be seen to the southeast at 168°. FAI-02065 is located approximately 50 m north of FAI-02070 on the same landform.

The ecotype is characterized as upland moist low and tall scrub. Vegetation consists of immature and mature spruce with an understory of tall grasses, fireweed, moss, and lichen (Figure 214). Surface visibility is 98% on the slopes and approximately 50% on the level crest. Disturbance is heavy due to wind and water erosion.

Site FAI-02070 was identified on the basis of nine pieces of lithic debitage (Table 37) and one uniface (Table 38, Figure 215) found on the surface.

Site stratigraphy is unknown due to lack of subsurface testing; however, FAI-02066 exists on the same landform approximately 175 m to the northwest. The two sites likely share similar stratigraphy.

FAI- 02071**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02071 is located on a point on a north-facing terrace edge (Figure 216, Figure 217). UTM coordinates are [REDACTED]. Site elevation is 209 masl. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below and approximately 45° to the east into the drainage channel 10-15 m below. The landform extends to the south for at least 50 m. FAI-02072 is located roughly 40 m to the east on the opposite side of the drainage channel. The nearest water source is a north-south flowing drainage creek approximately 300 m to the east of the site.

The location would offer roughly a 250° view; however, thick vegetation in the form of upland moist mixed broadleaf/needleleaf forest obscures the viewshed (Figure 218). The vegetation is comprised of spruce, aspen, tamarack, and birch with an understory of forbs, grasses, fireweed, low bush cranberries, moss, and lichen. Surface exposure is roughly 10%.

Site FAI-2071 was found through subsurface testing. Three 50 m x 50 m test pits were excavated. One test pit contained cultural material, including three pieces of lithic debitage: one from 0-10 cm BS, one from 20-30 cm BS, and one from 30-40 cm BS (Table 39).

Site stratigraphy consists of aeolian silts at least 56 cm thick overlying poorly sorted basal silty gravels (Figure 219, Figure 220).

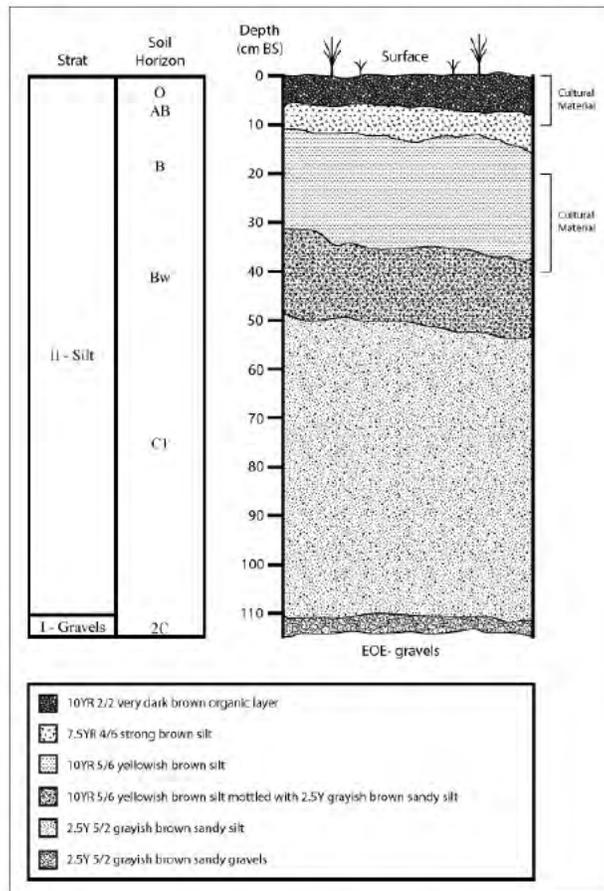

Figure 219. FAI-02071 stratigraphy

FAI-02072**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02072 is located on a point formed where a small unnamed drainage intersects a north-facing terrace edge (Figure 221, Figure 222). UTM coordinates are [REDACTED]. Site elevation is 210 masl. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below. The landform slopes approximately 45° to the northwest into the drainage channel 10-15 m below. FAI-02071 is located approximately 40 m to the west on the opposite side of the unnamed drainage channel. The nearest water source is a drainage creek that flows north-south approximately 300 m east of the site.

The ecotype is characterized as mixed broadleaf/needleleaf forest (Figure 223). Vegetation is thick and consists of spruce, aspen, tamarack, alder, and birch with an understory of forbs, grasses, fireweed, low bush cranberries, moss, and lichen. No disturbances were observed. Surface exposure is roughly 5%.

Site FAI-02072 was found through subsurface testing. Three 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including two pieces of debitage dispersed from 0-20 cm BS (Table 40).

Site stratigraphy consists of aeolian silts at least 93 cm thick overlying poorly sorted basal sandy gravel (Figure 224, Figure 225).

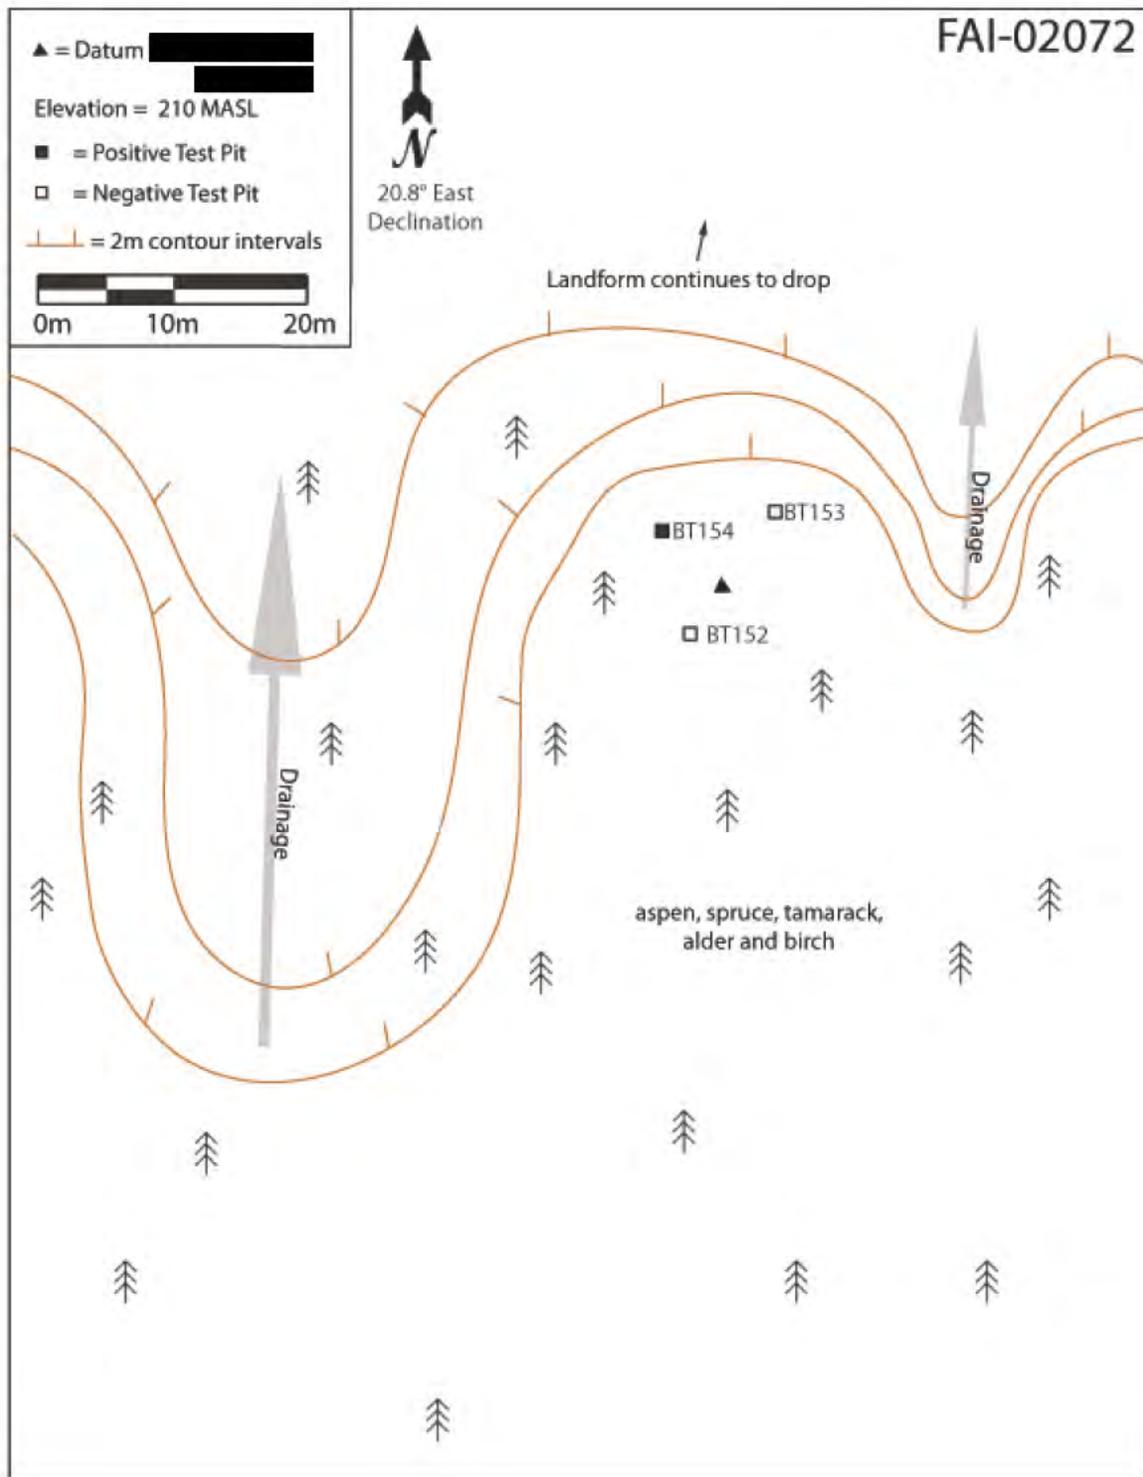

Figure 220. FAI-02072 sketch map

Figure 223. FAI-02072 test pit stratigraphy

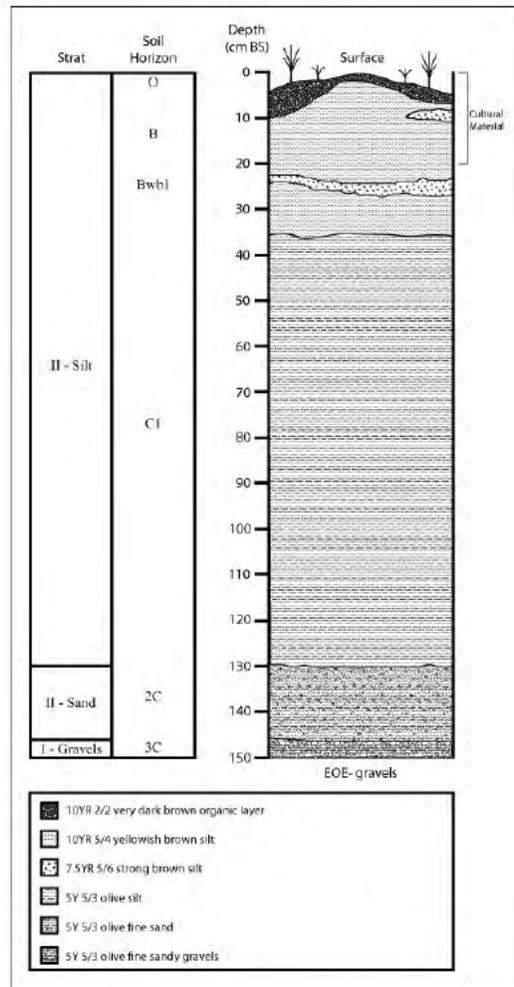

Figure 224. FAI-02072 stratigraphy

FAI-02073**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Eligible (See DOE form in Appendix 1)

Site FAI-02073 is located on the edge of a north-facing alluvial terrace elevated approximately 15 m above the tussocks and valley floor below (Figure 226, Figure 227). UTM coordinates are [REDACTED]. Site elevation is 213 masl. The highest point of the terrace is approximately 80 m north-south and 40 m east-west. Two unnamed drainage channels converge 20 m directly north of FAI-02073 to become the main water source in the area which flows northeast to the Tanana Flats. The viewshed from the northern tip of the landform is roughly 270°.

The ecosystem is characterized as upland moist needleleaf forest (Figure 228). Vegetation consists mainly of young spruce, tamarack, and willow with an understory of moss and lichen. Surface visibility is less than 5%.

Site FAI-02073 was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated. Two test pits contained cultural material, including 30 pieces of lithic debitage recovered from 0-45 cm BS (Table 41). Two microblades (Table 42, Figure 229) and one microblade core (Table 43, Figure 230) were found in situ at 45 cm BS, and one microblade core tablet was recovered from 0-40 cm BS (Table 44, Figure 231). Site stratigraphy consists of aeolian silts at least 46 cm deep overlying poorly sorted basal sandy gravels (Figure 232, Figure 233).

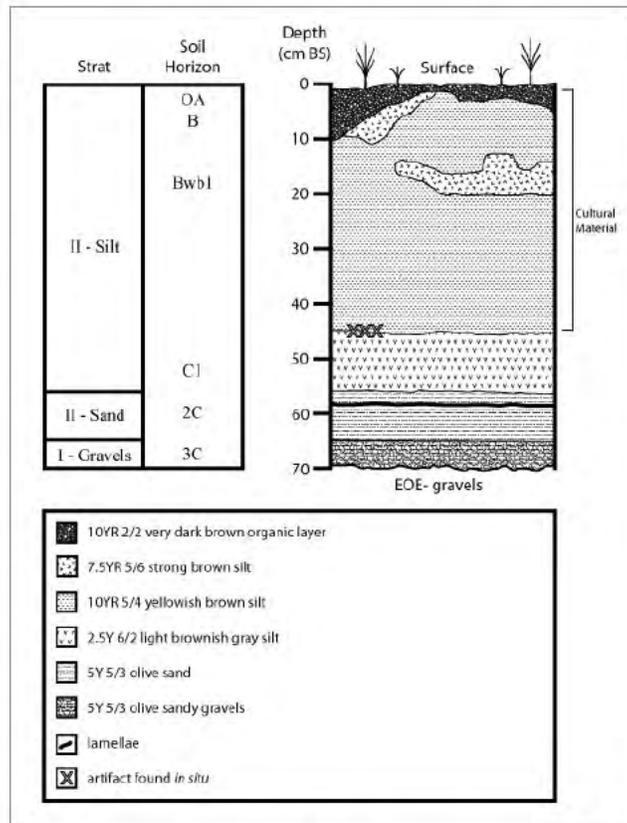

Figure 232. FAI-02073 stratigraphy

FAI-02074**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02074 is located on a point formed where a large drainage bisects a roughly east-west trending terrace edge (Figure 234, Figure 235). UTM coordinates are [REDACTED]. Site elevation is 214 masl. The landform is approximately 70 m north-south and 20 m east-west. The eastern edge slopes steeply at about 55° into a drainage channel roughly 15 m below; while the northern edge slopes at 45° dropping 15 m to the flats below. There is a clear view of FAI-02050 to the northwest on the opposite side of the drainage channel. The closest water source is a stream in the drainage channel which flows north-south approximately 65 m to the east.

The location would offer a 300° view of the Tanana Flats, and the drainage to the east would be clear from the northern tip of the crest; however, vegetation in the form of upland broadleaf forest obscures the view (Figure 236). The vegetation is dominated by mature aspen with an understory of low scrub, immature alder, moss, and lichen. The surface visibility is approximately 60%. No disturbances were observed.

Site FAI-02074 was found through subsurface testing. Three 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one translucent black (2.5/N) broken 10-20 mm obsidian flake (UA2010-216) collected from 0-10 cm BS.

Site stratigraphy consists of aeolian silts at least 40 cm thick overlying poorly sorted basal gravels (Figure 237, Figure 238).

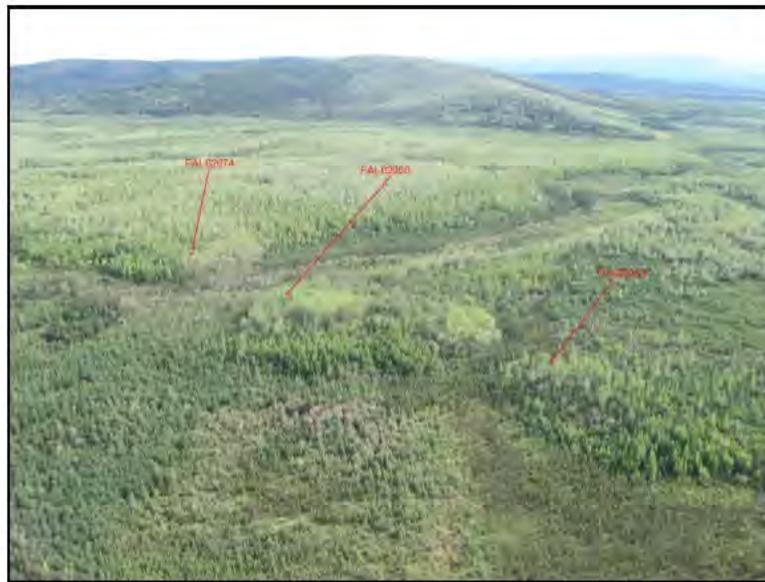

Figure 233. FAI-02074 aerial overview (view to south)

FAI-02075

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02075 is located on the northwest corner of a point formed where a channel bisects a north-facing terrace edge (Figure 239, Figure 240). UTM coordinates are [REDACTED]. Site elevation is 210 masl. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below, and approximately 45° to the east into the drainage channel 10-15 m below. No flowing creeks or ponds were observed in the immediate area. Without foliage present, the viewshed offers roughly 270°. The hills of Fairbanks can be seen to the northeast, Clear Creek Buttes are approximately 25 km away to the northwest at roughly 326°, and the outline of Dry Creek can be seen approximately 3 km to the north.

The ecotype is characterized as upland mixed broadleaf/needleleaf forest (Figure 241). The vegetation consists of spruce and dwarf birch with an understory of high-bush cranberry, fireweed, moss, and lichen. Surface visibility is approximately 20-50%. No disturbance was observed.

Site FAI-02075 was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one 7.5-10 mm reddish gray (5YR 5/2) complete chert flake recovered from 10-20 cm BS and one dark gray (10YR 4/1) bifacially flaked cobble recovered from 8-14 cm BS (Table 45, Table 46, Figure 242).

Site stratigraphy consists of aeolian silts at least 60 cm thick overlying poorly sorted basal sandy gravels (Figure 243, Figure 244).

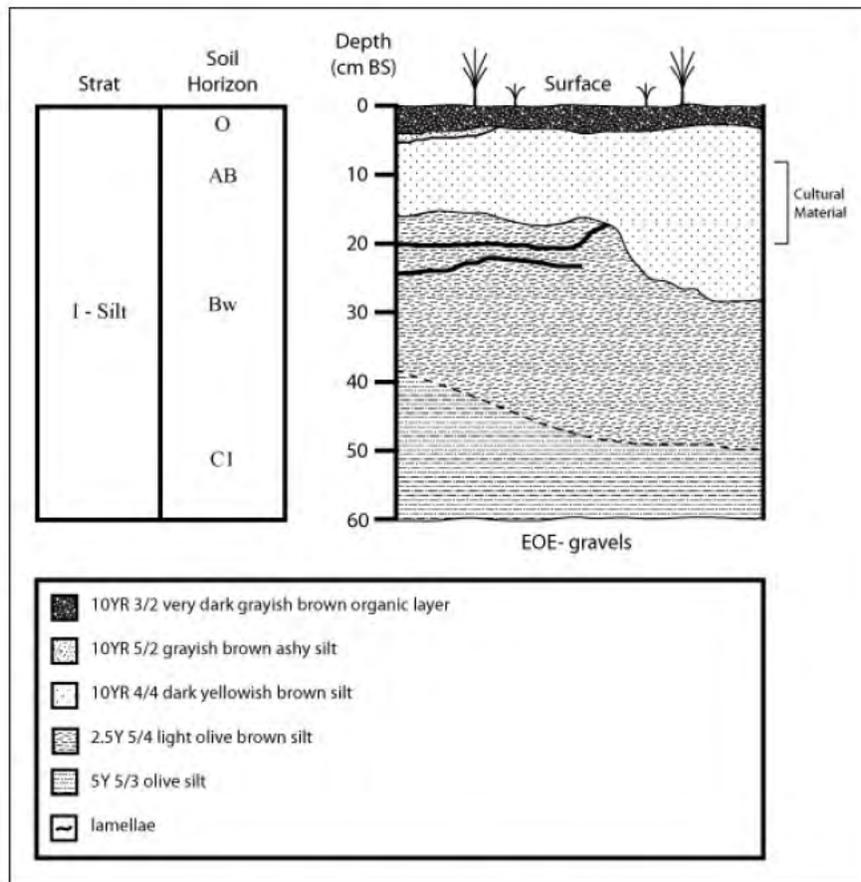

Figure 243. FAI-02075 stratigraphy

FAI-02076**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not determined

Site FAI-02076 is located on the edge of a north-facing terrace (Figure 245, Figure 246). UTM coordinates are [REDACTED]. Site elevation is 209 masl. The site is located to the west of a narrow unnamed drainage channel that creates a point where it intersects the terrace. The landform slopes approximately 45° to the northeast into the Tanana Flats roughly 15 m below and 50° to the east into the drainage channel 10-15 m below. FAI-02077 is located roughly 50 m to the west on the opposite side of the drainage channel.

The location would offer roughly 270° of view; however, vegetation in the form of upland moist mixed broadleaf/needleleaf forest obscures the view (Figure 247). The vegetation consists of birch, tamarack, and spruce with an understory of moss and lichen. Surface visibility is 10-20%. No disturbances were observed.

Site FAI-02076 was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one 10-20 mm, dark gray (4/N) broken basalt flake (UA2010-218) collected from 10-20 cm BS.

Site stratigraphy consists of aeolian silts at least 58 cm thick overlying poorly sorted sandy gravels (Figure 248, Figure 249).

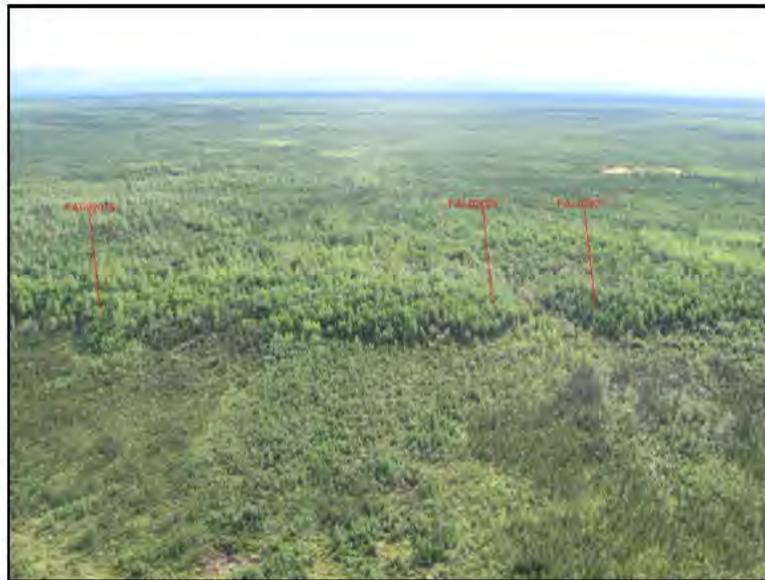

Figure 244. FAI-02076 aerial overview (view to south)

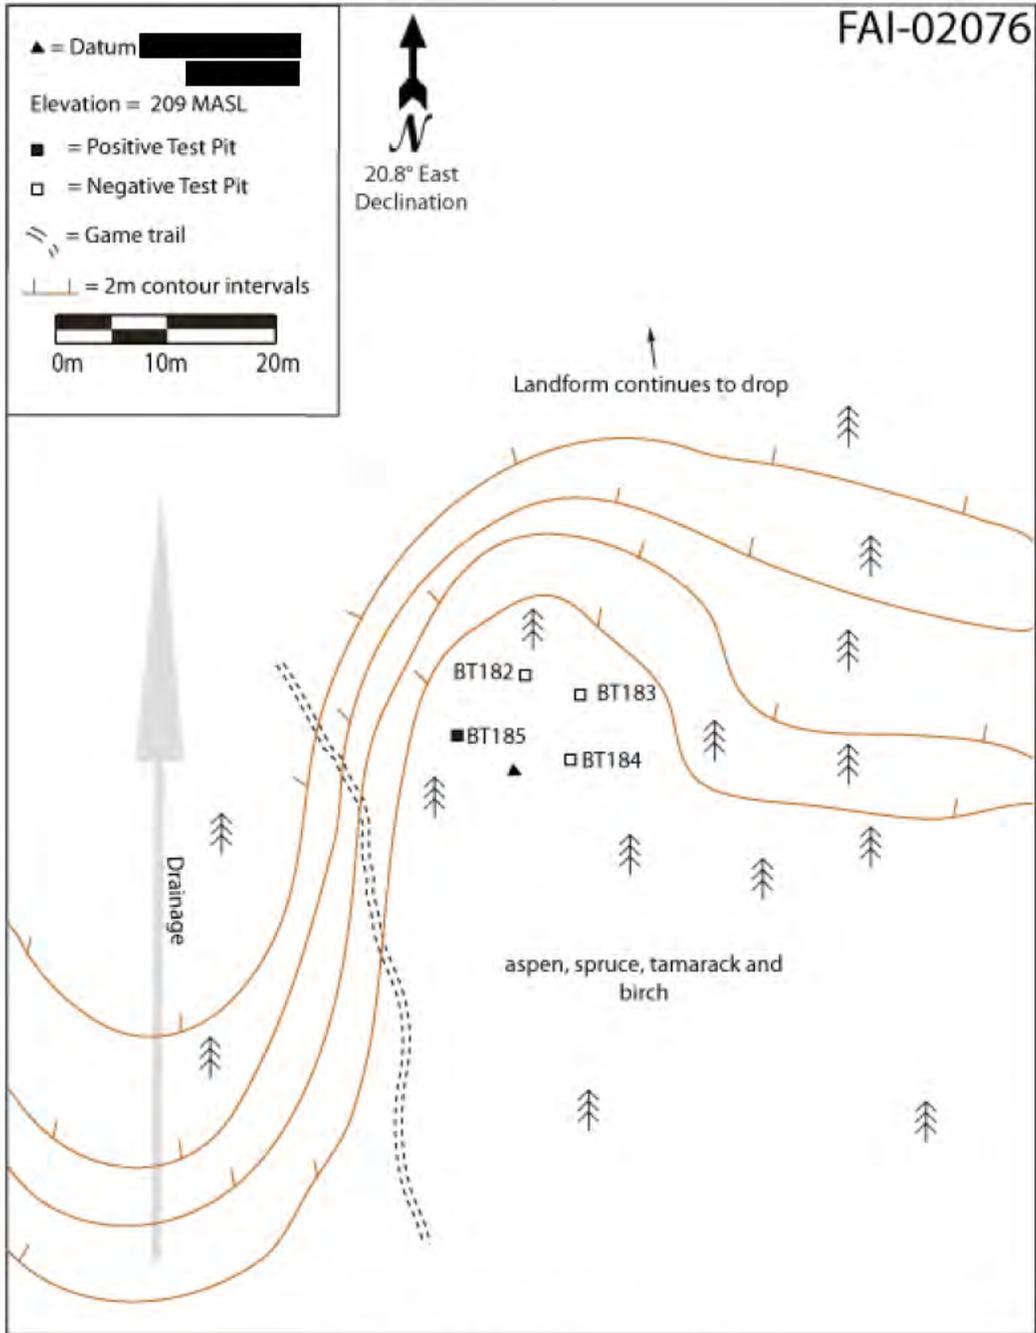

Figure 245. FAI-02076 sketch map

Figure 246. FAI-02076 overview (view to east)

Figure 247. FAI-02076 test pit stratigraphy

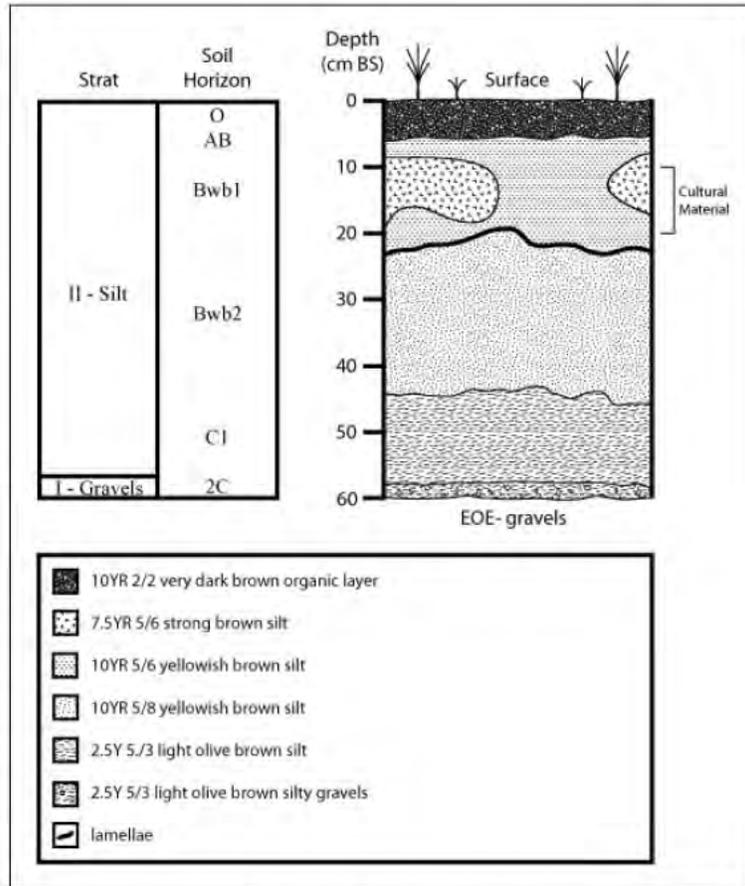

Figure 248. FAI-02076 stratigraphy

FAI-02077

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Eligible (See DOE form in Appendix 1)

Site FAI-02077 is located on a north-facing terrace edge (Figure 250, Figure 251). UTM coordinates are [REDACTED]. Site elevation is 213 masl. The site is located to the west of a narrow unnamed drainage channel that runs into the flats below. The landform slopes approximately 45° to the northeast into the flats roughly 15 m below. Site elevation is 213 masl. FAI-02076 is located roughly 50 m to the east on the opposite side of the drainage channel. Without foliage present, the viewshed offers roughly 270° of unobstructed sight. The hills of Fairbanks can be seen to the northeast, Clear Creek Buttes can be seen approximately 25 km away to the northwest at 326°, and the outline of Dry Creek can be seen approximately 3 km to the north.

The ecotype is described as upland moist mixed broadleaf/needleleaf forest (Figure 252). Vegetation consists of birch, tamarack, and spruce with an understory of moss, mushrooms, and lichen. Surface visibility is 10-20%. Moderate bioturbation (animal dens) was located in the northeast corner.

Site FAI-02077 was found through subsurface testing. Seven 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one 10-20 mm dark gray (7.5YR 4/1) chert flake fragment (Table 47), one rhyolite biface (Table 48, Figure 253), and one chert microblade (Table 49, Figure 254) recovered from 20-30 cm BS.

Dispersed charcoal associated with cultural material at a depth of 31 cm BS produced an AMS ^{14}C date of 10130 ± 50 (Beta-283435).

Site stratigraphy consists of aeolian silts at least 145 cm thick. No underlying basal stratigraphy was encountered (Figure 255, Figure 256).

FAI-02078

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02078 is located on a finger that extends from a north-facing terrace edge (Figure 257, Figure 258). UTM coordinates are [REDACTED]. Site elevation is 208 masl. The finger on which the site is located protrudes to the northwest approximately 15 m above the flats below. The estimated size of the site is roughly 30 m east-west by 50 m north-south. Narrow drainage channels border the finger to the east and west of the site. The hills of Fairbanks can easily be seen to the northeast, Clear Creek Buttes are roughly 25 km away to the northwest at 325°, and the outline of Dry Creek is approximately 3 km to the north. FAI-02067 is located roughly 45 m to the east on the opposite side of a drainage channel. FAI-02069 is located roughly 40 m to the west on the opposite side of another drainage channel. The nearest source of water is a north-south flowing drainage creek approximately 250 m east of the site.

The ecotype is characterized as upland mixed broadleaf/needleleaf forest (Figure 259). The vegetation consists of spruce, birch, aspen, and tamarack, with an understory of alder, grass, forbs, and moss. No disturbances were observed. Surface exposure is roughly 5%.

Site FAI-02078 was found through subsurface testing. Nine 50 cm by 50 cm test pits were excavated. One test pit contained cultural material, including one 10-20 mm, very dark gray (10YR 3/1) chert flake fragment (UA2010-220) recovered from 30-40 cm BS.

Site stratigraphy consists of aeolian silt at least 74 cm thick overlying poorly sorted silty gravels (Figure 260, Figure 261).

Figure 256. FAI-02078 aerial overview (view to south)

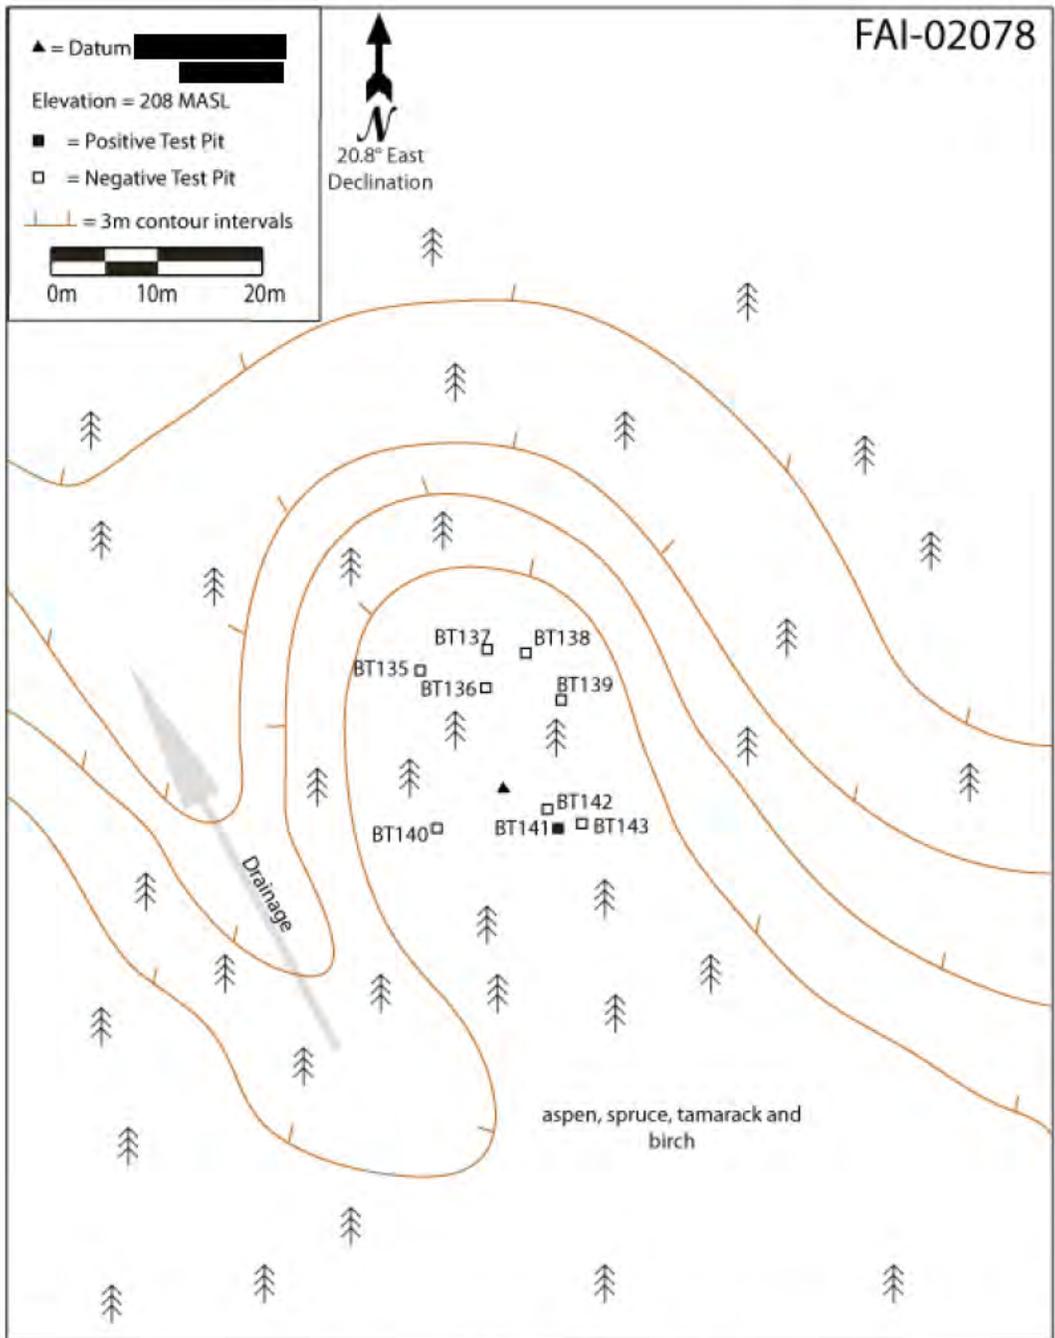

Figure 257. FAI-02078 sketch map

4.3.2 Dune Field

Sixteen locations were positive for cultural remains, resulting in the identification of 17 prehistoric archaeological sites (Figure 262). All of these contained buried remains and were discovered through subsurface testing. The following paragraphs describe these 17 sites.

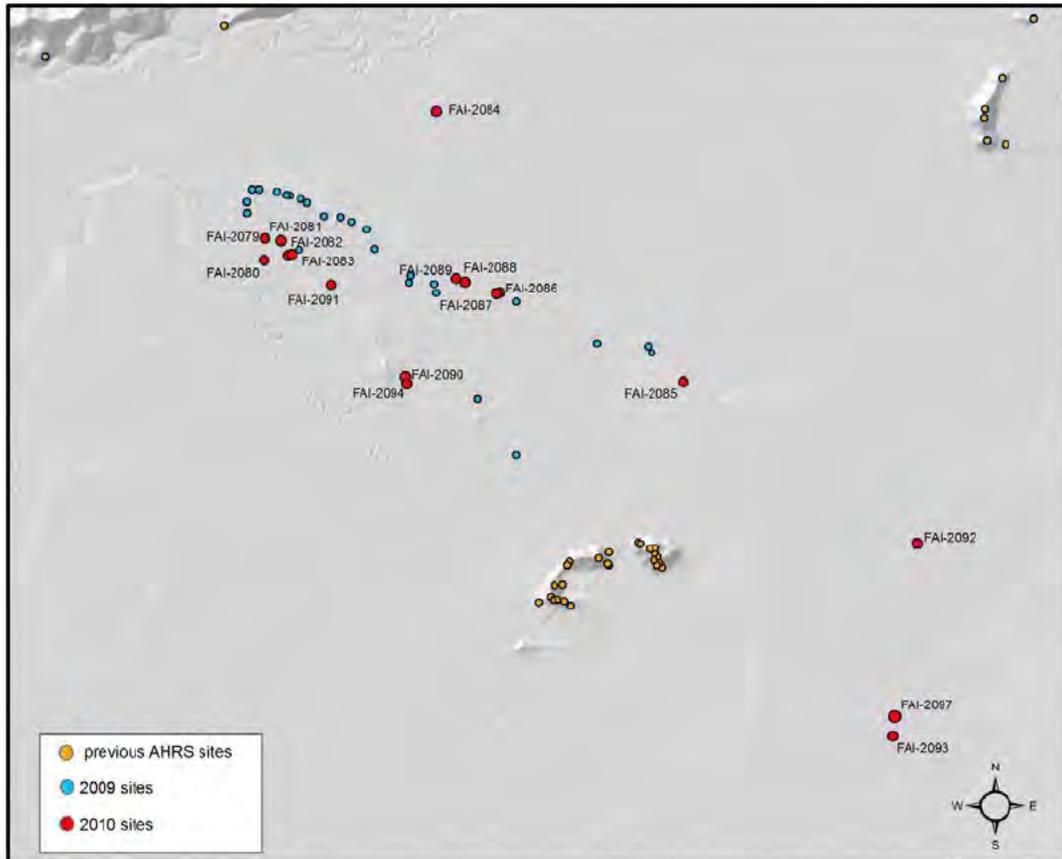

Figure 261. Prehistoric sites discovered in dune field in 2009 and 2010

FAI-02079

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not determined

Site FAI-02079 is located on an ovate east-west trending vegetated sand dune (Figure 263, Figure 264). UTM coordinates are [REDACTED]. Site elevation is 139 masl. The crest of the dune is approximately 40-50 m in diameter. The crest is offset approximately 20 m west from the center of the dune. The north, west and south sides of the dune slope down at approximately 15° to the tussocks below. The east side of the dune slopes

more gradually at 10°. The viewshed would be 360° without vegetation. The hills of Fairbanks can be seen to the northwest. The outline of the Wood River is approximately 600 m to the west. The Wood River is the closest source of water other than the saturated tussocks that surround the site.

The ecosystem is characterized as upland low and tall scrub (Figure 265). Burned spruce lay scattered across the dune. The live vegetation consists of young spruce, young alder, rose, low grasses, forbs, and moss. Surface visibility is approximately 20%. Moderate tree throw disturbance is present due to forest fire. All observed disturbances are natural.

Site FAI-02079 was found through subsurface testing. Five 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including two rhyolite flakes (Table 50) recovered from 20-44 cm BS.

Site stratigraphy consists of aeolian silts and sands at least 120 cm overlying aeolian dune sands (Figure 266, Figure 267).

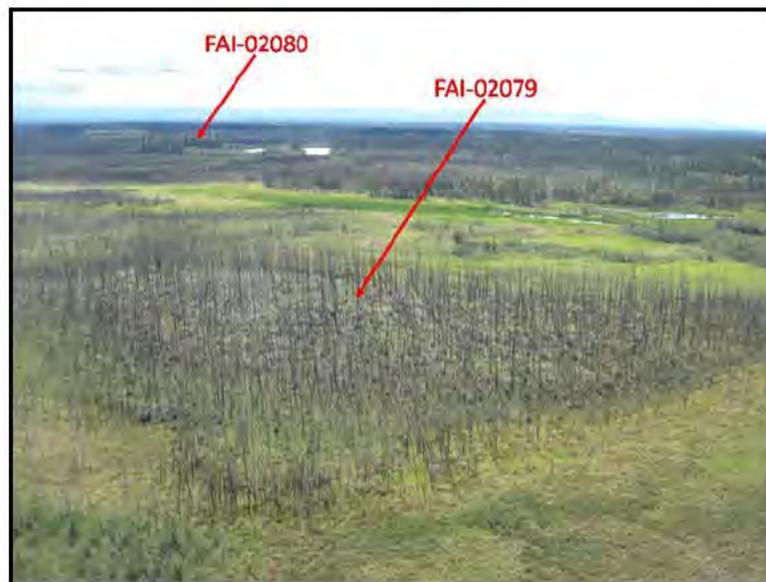

Figure 262. FAI-02079 aerial overview (view to west)

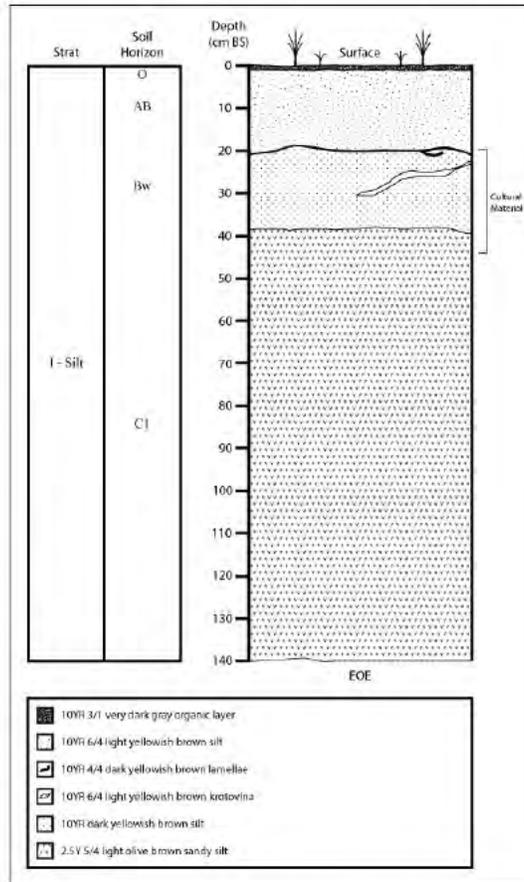

Figure 266. FAI-02079 stratigraphy

FAI-02080

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02080 is located on the crest of an incised vegetated sand dune (Figure 268, Figure 269) located on the right hand bank of the Wood River. UTM coordinates are [REDACTED]. Site elevation is 144 masl. The site is located on the northern corner of the crest of the landform. The landform is elevated approximately 20 m above the river. The landform is approximately 250 m long north-south and 80 m wide east-west. The landform is crescent-shaped. The slope of the site is approximately 0°-10°. The areas to the north, east, and south of the site slope at roughly 10-20°. The slope to the west into the river is approximately 75°. Murphy Dome can be seen to the north at 6°. The Wood River is directly below the site and is the closest source of water. Surface visibility is approximately 90% in the northern quarter, 20% in the southern three-quarters, and 100% in the eroded face that slopes down to the river.

The location would offer a 360° view; however, thick vegetation in the form of upland moist mixed broadleaf/needleleaf forest obscures the view to the west (Figure 270). The vegetation consists of mature spruce and aspen with an understory of short scrub, alder, rose, fireweed, high-bush cranberry, and moss. The northern quarter of the landform is thinly vegetated and has been used recently as a hunting camp. The vegetation on the southern three-quarters of the landform is much thicker. The same types of flora can be found over the entire landform.

Site FAI-02080 was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one 10-20 mm, dark gray (10YR 4/1) basalt flake fragment (UA2010-222) recovered from 20-30 cm BS.

Site stratigraphy consists of aeolian silts at least 120 cm thick overlying aeolian dune sands (Figure 271, Figure 272).

Figure 267. FAI-02080 aerial overview (view to east)

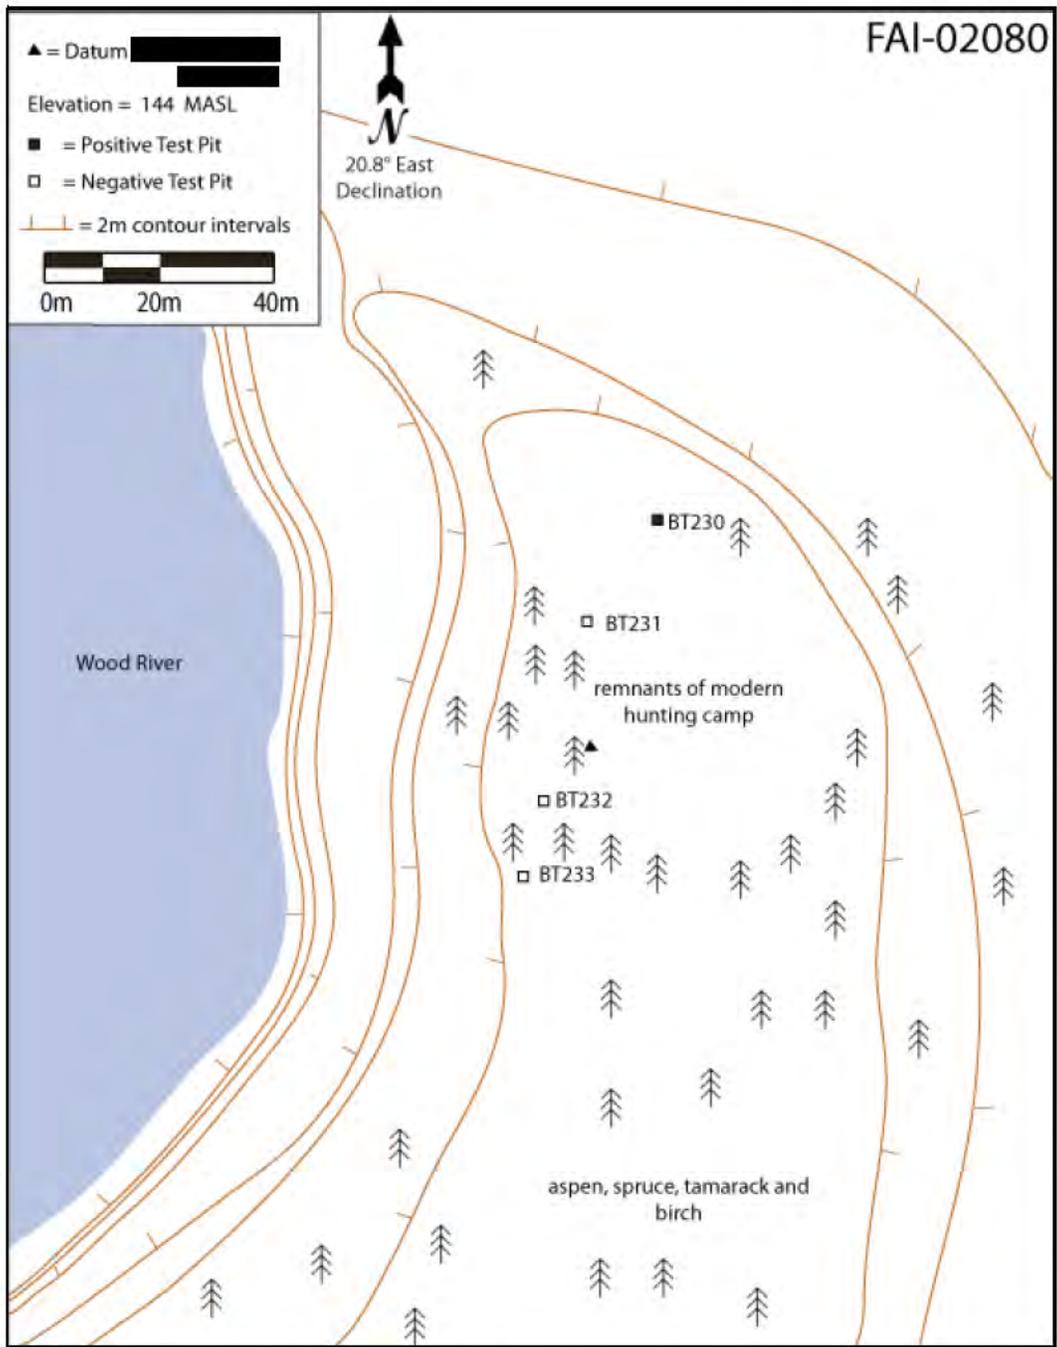

Figure 268. FAI-02080 sketch map

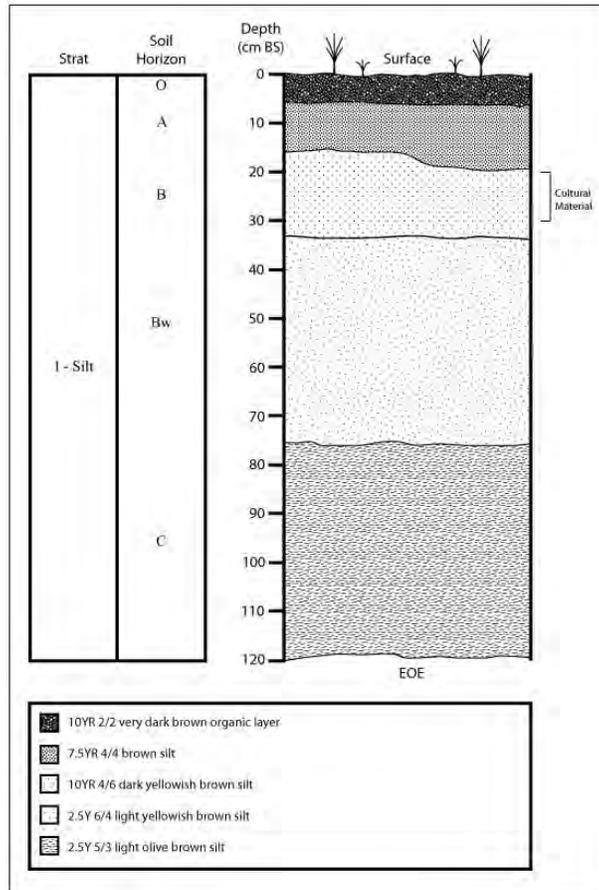

Figure 271. FAI-02080 stratigraphy

FAI-02081

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site FAI-02081 is located on an east-west trending, ovate vegetated sand dune (Figure 273, Figure 274). UTM coordinates are [REDACTED]. Site elevation is 142 masl. The estimated size of the site is based on the dune size at 120 m by 60 m. The site area has 0-10° slope. The north/northeast edge of the dune slopes at approximately 10-20°, and the dune slopes roughly 10° to the south, east, and west. The landform drops in elevation approximately 10 m to the tussocks of the Tanana Flats. The landform has a 180° viewshed to the north/northwest.

The ecosystem is characterized as upland mixed needleleaf/broadleaf forest (Figure 275). Site vegetation primarily consists of young spruce, aspen, mosses, wild roses, alder, high/low-bush

cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface exposure is 5%. No unnatural disturbances were observed.

Site FAI-02081 was identified through subsurface testing. Cultural material was recovered from one of four 50 cm by 50 cm test pits excavated. In total, 10 flakes (Table 51) and one microblade fragment (Table 52, Figure 276) were recovered from one test pit at 0-40 cm BS. An additional piece of flaked stone debitage was found at a depth of 80-90 cm BS.

Site stratigraphy consists of aeolian silts at least 40 cm thick overlying aeolian dune sands (Figure 277, Figure 278).

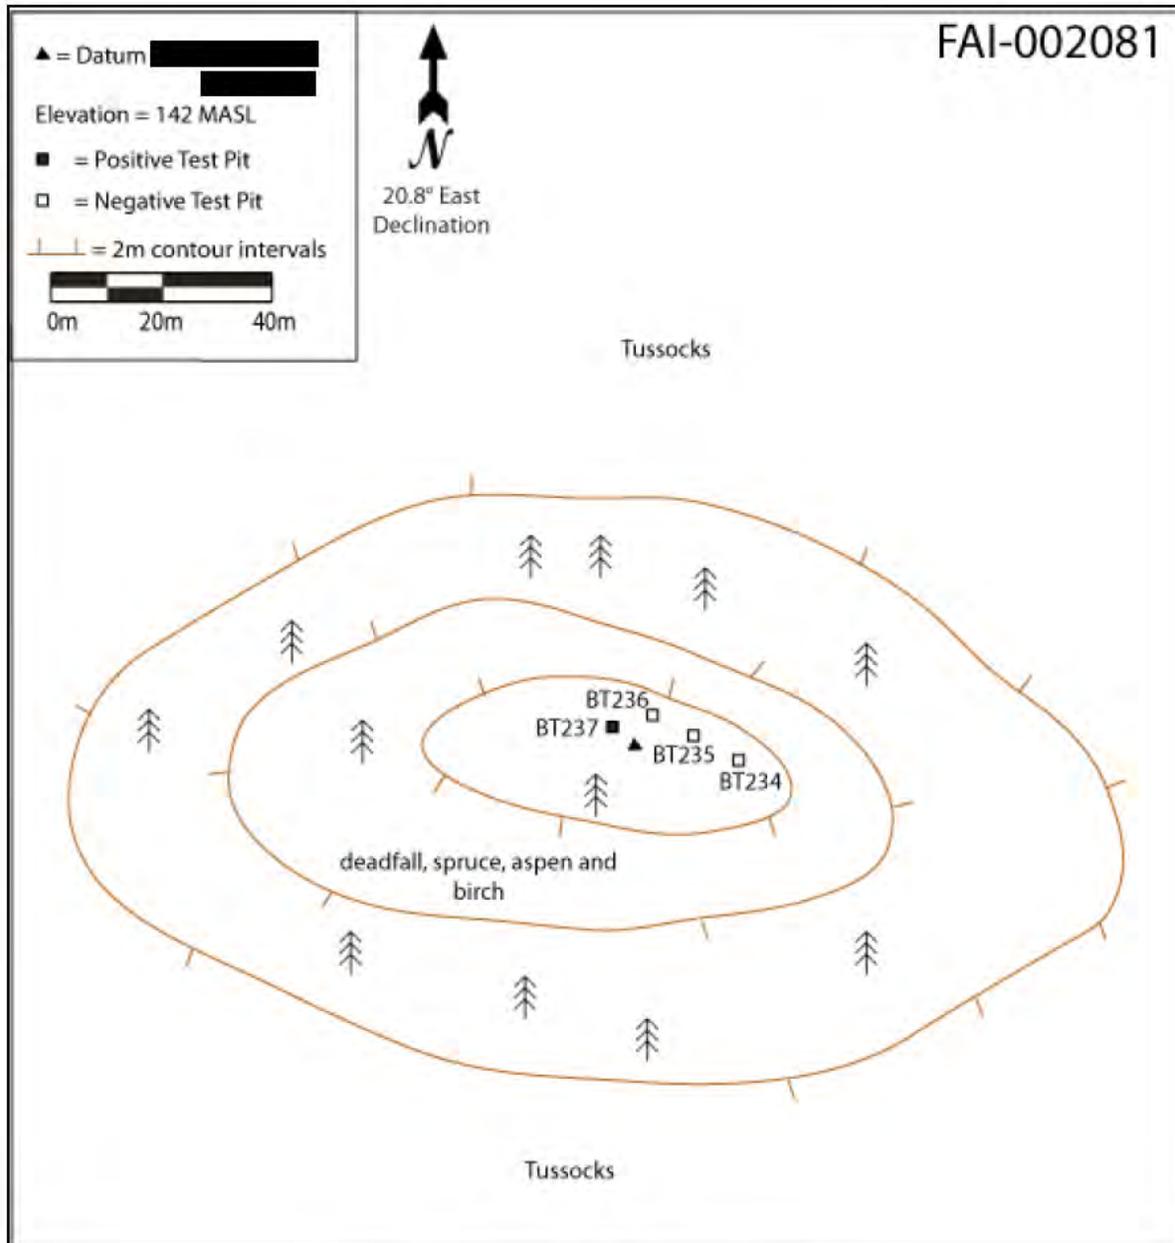

Figure 272. FAI-02081 sketch map

FAI-02082

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not evaluated

Site FAI-02082 is located at the western tip of a narrow peninsular sand dune lobe that protrudes to the west from a higher sand dune (Figure 279, Figure 280). UTM coordinates are [REDACTED]. Site elevation is 141 masl. The site is elevated approximately 15 m above the tussocks below. The crest of the finger is approximately 20 m north-south and 120 m east-west. The slope drops to the north, west and south at approximately 10-20°. The slope of the site is 0-10%. Site FAI-02083 is located approximately 150 m away to the northeast at 68°. No bodies of water can be seen from the landform. The tussocks surrounding the site, however, are saturated.

The ecosystem is described as upland moist mixed broadleaf/needleleaf forest (Figure 281). Burned spruce and aspen lay scattered across the landform. Live vegetation consists of alder, fireweed, tall grass, moss and lichen. Surface visibility is approximately 40%. No unnatural disturbances were observed.

Site FAI-02082 was found through subsurface testing. Three 50 cm x 50 cm test pits were excavated. One test pit contained cultural material, including one retouched flake recovered from 20-30 cm BS (Table 53, Figure 282).

Site stratigraphy consists of aeolian silts and sands at least 120 cm thick overlying aeolian dune sands (Figure 283, Figure 284).

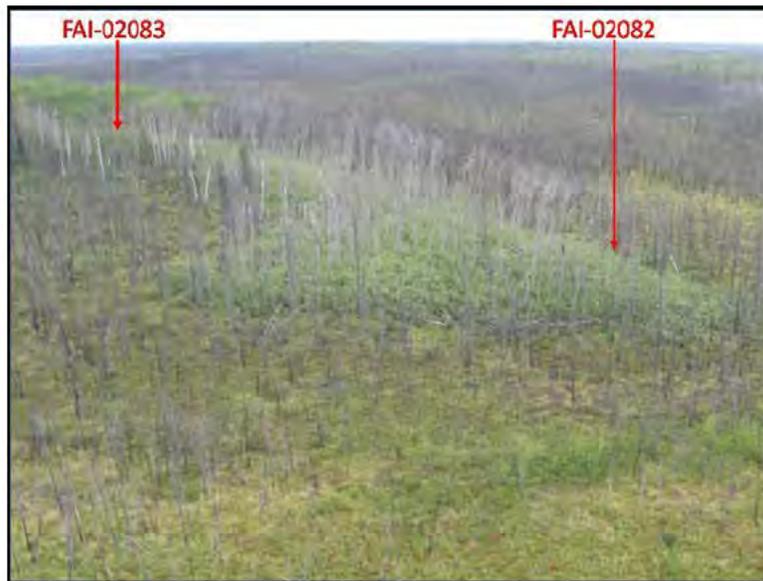

Figure 278. FAI-02082 aerial overview (view to south)

FAI-02083**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02083 is located on the crest of a large parabolic sand dune (Figure 285, Figure 286). UTM coordinates are [REDACTED]. Site elevation is 148 masl. The landform on which the site is located is approximately 400 m long northeast-northwest and 50 m wide north-south. The landform is elevated 20-25 m above the tussocks which surround it. The slope of the site is roughly 0-10°, and the ground slopes in all directions roughly 10-20°. The Wood River can be seen approximately 1.5 km to the west, and Denali is visible to the southeast at 160°. FAI-02082 is located approximately 150 m away to the southwest at 248°. An unnamed creek flows east-west approximately 300 m north of FAI-02083 and is the closest source of water.

The location would offer a 360° viewshed if not for thick vegetation in the form of upland mixed broadleaf/needleleaf forest obscuring the view (Figure 287). Vegetation consists of mature aspen with an understory of young alder, fireweed, rose, high-bush cranberry, and moss. Many of the aspen are burned, and deadfall is present but minimal. Surface visibility is roughly 10%.

Site FAI-02083 was found through subsurface testing. Five 50 cm by 50 cm test pits were excavated. One test pit contained cultural material, including 46 chert and rhyolite flakes recovered from 0-20 cm BS (Table 54).

Site stratigraphy consists of aeolian silts at least 120 cm thick overlying aeolian dune sands (Figure 288, Figure 289).

Figure 284. FAI-02083 aerial overview (view to southeast)

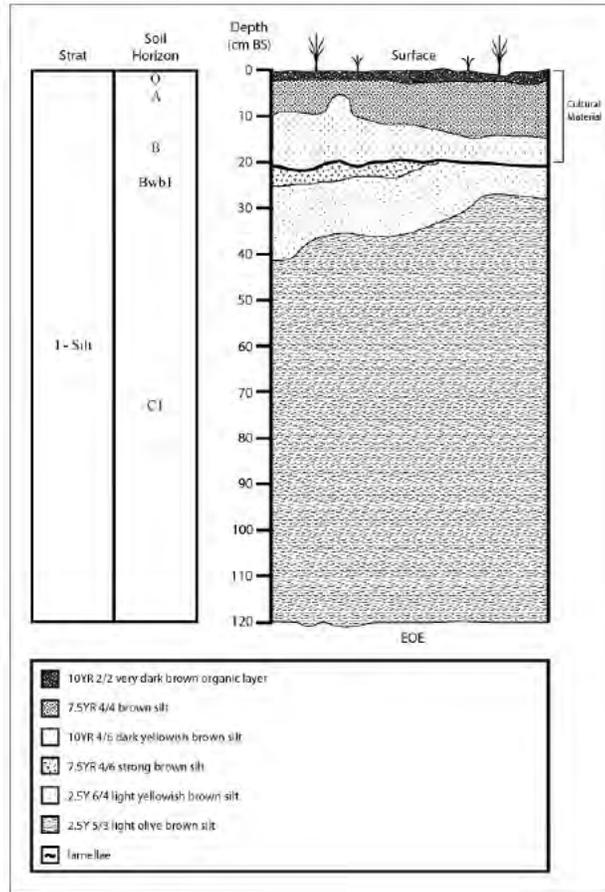

Figure 288. FAI-02083 stratigraphy

FAI-02084

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not evaluated

Site FAI-02084 is located on a low ovate vegetated sand dune in the Tanana Flats (Figure 290, Figure 291). UTM coordinates are [REDACTED]. Site elevation is 134 masl. The dune is oriented roughly west-southeast. The crest of the dune is located

approximately 5 m above the surrounding tussocks and is approximately 50 m long east-west and 30 m wide north-south. The slope of the site is approximately 0°-10°, and the slope of the area surrounding the site is approximately 10-13°. The landform on which FAI-02084 is located is the central dune in a small complex of three dunes: one low dune is approximately 80 m west at 270°, the other dune is approximately 80 m to the southeast at 142°.

The location would offer a 360° view; however, thick vegetation in the form of thick young aspen and burned stumps obscures the view (Figure 292). No large water sources are visible; however, the surrounding tussocks are saturated. Vegetation consists of standing burned mature spruce and aspen with an understory of high-bush cranberry, rose, low alder, horsetail, and moss. Surface visibility is approximately 30%.

Site FAI-02084 was identified on the basis of one lithic flake fragment found on the surface in a tree throw. One 50 cm x 50 cm test pit was excavated and contained cultural material, including two pieces of lithic debitage collected from 0-25 cm BS (Table 55).

Site stratigraphy consists of aeolian silts at least 54 cm thick overlying basal aeolian dune sands (Figure 293, Figure 294).

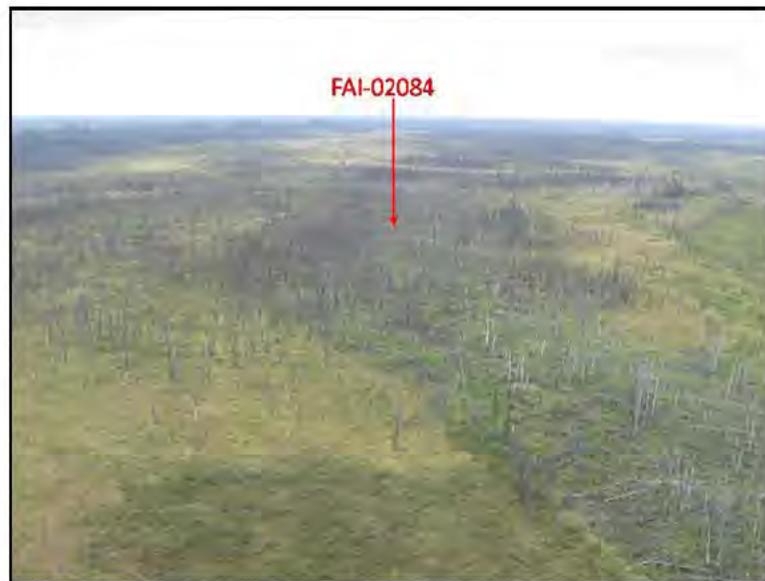

Figure 289. FAI-02084 aerial overview (view to east)

Figure 292. FAI-02084 test pit stratigraphy

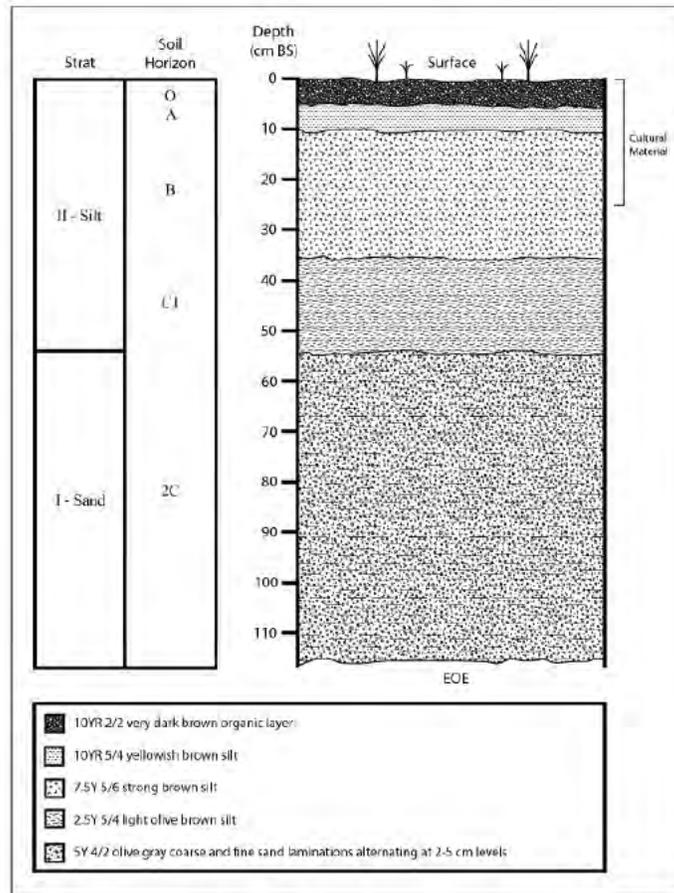

Figure 293. FAI-02084 stratigraphy

FAI-02085

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not evaluated

Site FAI-02085 is located on a large vegetated sand dune in the Tanana Flats (Figure 295, Figure 296). UTM coordinates are [REDACTED]. Site elevation is 169 masl. This compound dune is irregular in shape with multiple fingers protruding in different directions. The site is located on the northeastern corner of the dune. The site is elevated approximately 20-25 m above the tussocks below. A narrow drainage channel skirts the landform to the northeast where it drops into the tussocks at approximately 25°. The rounded northern and western sides of the landform drop steeply at 30° into the tussocks. The landform extends without an elevation change for at least 80 m to the south. The slope of the site is

approximately 0-8°. An unnamed creek can be seen approximately 150 m to the north. A large pond is located approximately 500 m to the northwest of the site

The location would offer approximately a 240-270° view if not obscured by vegetation (Figure 297). Vegetation on the site consists of mature aspen with an understory of low alder, low-bush cranberry, young spruce, rose, willow, and moss. The surrounding slopes are dominated by mature spruce with an understory of moss. Surface visibility is approximately 10%.

Site FAI-02085 was located through subsurface testing. Three 50 cm by 50 cm test pits were excavated. One test pit contained cultural material, including one 7.5-10 mm, pale brown (10YR 6/3) broken rhyolite flake (UA2010-227) recovered from 0-27 cm BS.

The stratigraphy consists of aeolian silts at least 120 cm thick overlying aeolian dune sands (Figure 298, Figure 299).

Figure 294. FAI-02085 aerial overview (view to north)

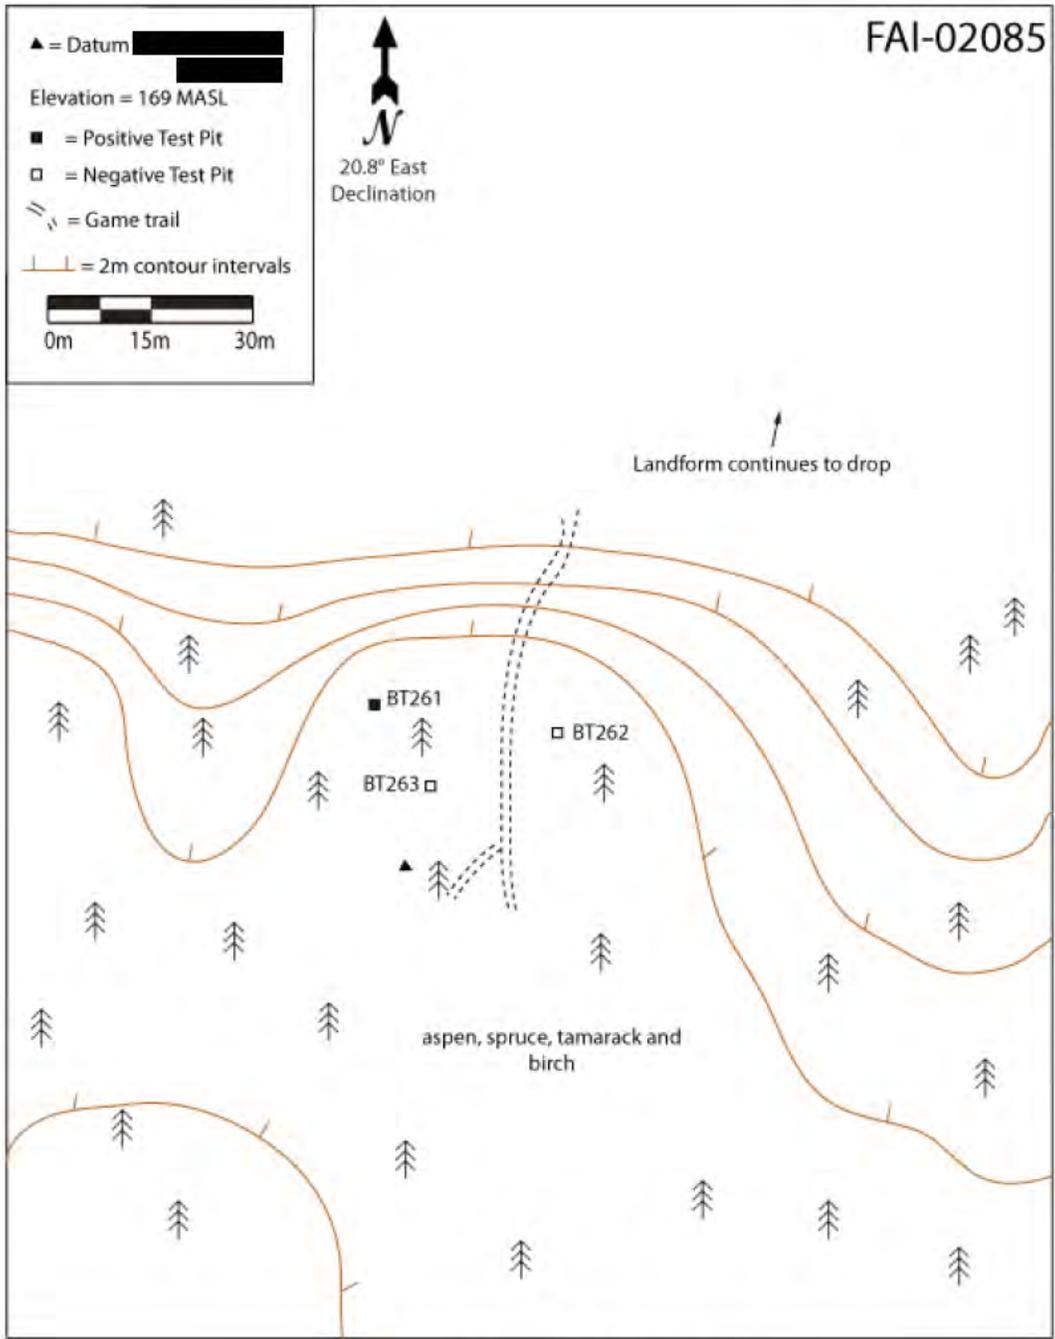

Figure 295. FAI-02085 sketch map

Figure 296. FAI-02085 overview (view to west)

Figure 297. FAI-02085 test pit stratigraphy

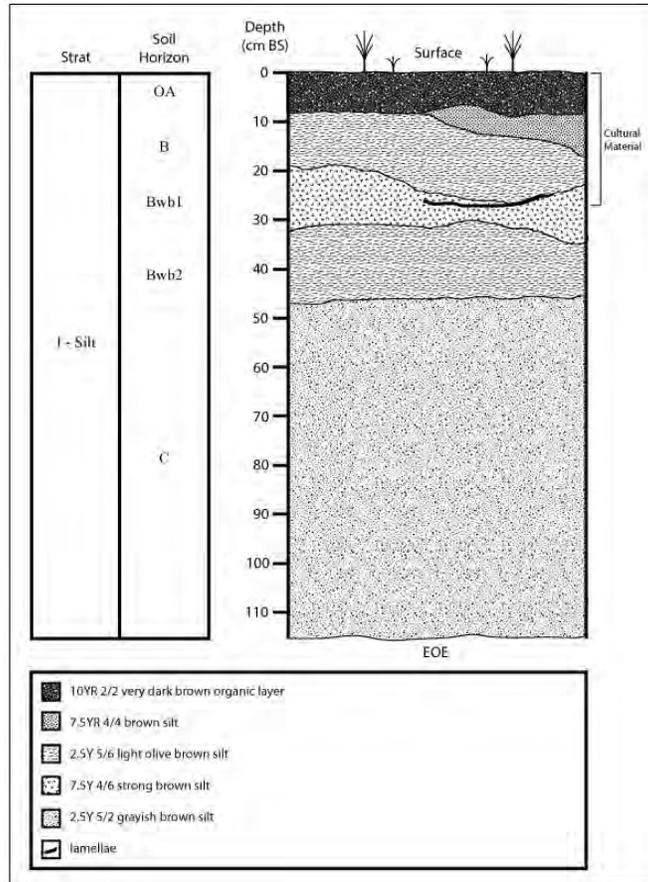

Figure 298. FAI-02085 stratigraphy

FAI-02086

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site FAI-02086 is located on the eastern half of a large east-west trending, ovate vegetated sand dune (Figure 300, Figure 301). UTM coordinates are [REDACTED]. Site elevation is 158 masl. The estimated size of the landform is 130 m by 50 m. A saddle that drops 2-3 m to the west separates the western and eastern crests of the dune. The eastern crest of the dune is roughly 60 m by 45 m with a 0°-10° slope. The northern edge of the dune slopes at roughly 30-40°. The dune slopes roughly 10° to the south, east, and west. The landform drops approximately 10 m to the tussocks below. The viewshed is 180° to the north. FAI-02087 is located approximately 130 m west of FAI-02086.

The ecosystem is characterized as upland mixed needleleaf/broadleaf forest (Figure 301). Site vegetation consists primarily of spruce and aspen with an understory of mosses, wild roses, high/low-bush cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. No water sources are visible; however, the surrounding tussocks are saturated. Surface exposure is 5%. No disturbances were observed.

Site FAI-02086 was identified through subsurface testing. One 50 cm by 50 cm test pit was excavated and contained cultural material, including one burin spall recovered from 5-20 cm BS (Table 56, Figure 303).

Site stratigraphy consists of aeolian silts at least 43 cm thick overlying basal aeolian dune sands (Figure 304, Figure 305).

FAI-02087**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02087 is located on the western half of a large east-west trending, ovate vegetated sand dune (Figure 306, Figure 307). UTM coordinates are [REDACTED]. Site elevation is 158 masl. The landform is roughly 130 m by 50 m. A saddle which drops 2-3 m in elevation separates the western and eastern crests of the dune. FAI-02086 is located approximately 130 m east of FAI-02087. The western crest of the dune is roughly 30 m by 45 m with a 0-10° slope. The northern edge of the dune slopes at about 25-30°. The dune slopes roughly 10° to the south, east, and west. The landform drops approximately 10 m to the flats below. The landform has a 180° viewshed to the north.

The ecosystem is characterized as upland mixed needleleaf/broadleaf forest (Figure 308). Site vegetation consists primarily of aspen with an understory of mosses, wild roses, high/low-bush cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface exposure is 0%. No disturbances were observed.

Site FAI-02087 was identified through subsurface testing. One 50 cm by 50 cm test pit was excavated and contained cultural material, including 14 flakes recovered from 0-30 cm BS (Table 57). No tools were recovered.

Site stratigraphy consists of aeolian silts at least 40 cm thick overlying aeolian basal dune sands (Figure 309, Figure 310).

FAI-02088**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02088 is located on the crest of an ovate vegetated sand dune (Figure 311, Figure 312). UTM coordinates are [REDACTED]. Site elevation is 153 masl. The crest of the dune is roughly 40 m x 50 m with a 0-10° slope. The dune slopes down on the northern half roughly 22°, dropping approximately 8-10 m in elevation to the tussocks below. The southern half of the dune landform slopes more gradually at approximately 15°. The crest of the dune is cut by a north-south oriented drainage channel, which descends 1-2 m below the crest. The crest of the landform provides a 360° viewshed with a clear view of site FAI-02089 approximately 400 m to the southwest at 255°.

The ecosystem is characterized as upland broadleaf forest (Figure 313). Site vegetation consists primarily of aspen with an understory of moss, wild rose, high/low-bush cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface exposure is less than 5%. No disturbance was observed.

Site FAI-02088 was identified through subsurface testing. Cultural material was recovered from two of the three 50 cm x 50 cm test pits excavated, including 11 flakes recovered from 15-60 cm BS (Table 58). No tools were recovered.

Site stratigraphy consists of aeolian silts at least 42 cm thick overlying aeolian dune sands (Figure 314, Figure 315).

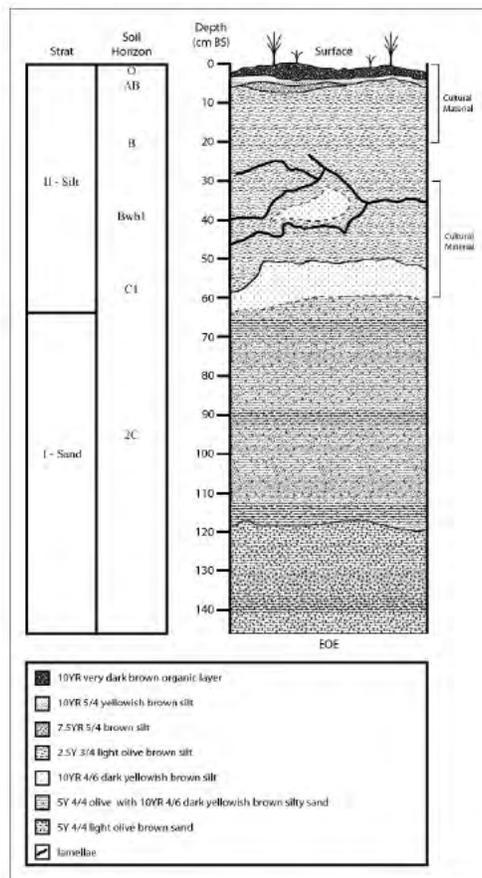

Figure 314. FAI-02088 stratigraphy

FAI-02089**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not Evaluated

Site FAI-02089 is located on the crest of the northern tip of a triangular-shaped vegetated sand dune (Figure 316, Figure 317). UTM coordinates are [REDACTED]. Site elevation is 149 masl. The crest of the dune is roughly 60 m in diameter with a 0-10° slope. The dune descends to the north at roughly 28°. The landform drops approximately 15-20 m in elevation to the tussocks below. The southern half of the landform slopes more gradually at about 10°. The crest of the landform would provide a 360° view; however, dense vegetation restricts the current viewshed. FAI-02088 can be seen approximately 400 m to the northeast at 75°.

The ecosystem is characterized as upland broadleaf forest (Figure 318). Site vegetation consists primarily of aspen with an understory of moss, wild rose, high/low-bush cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface exposure is less than 5%. No disturbances were observed.

Site FAI-02089 was identified through subsurface testing. Cultural material was collected from one of two 50 cm x 50 cm test pits excavated. A single pale brown (10YR 6/3) rhyolite flake fragment (UA2010-231), size class 10-20 mm, was recovered from one test pit at a depth of 10-20 cm BS. No tools were recovered.

Site stratigraphy consists of aeolian silts at least 69 cm thick overlying aeolian dune sands (Figure 319, Figure 320).

Figure 315. FAI-02089 aerial overview (view to west)

FAI-02090

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site FAI-02090 is located on the crest of low southeast-northwest trending, irregularly shaped vegetated sand dune (Figure 321, Figure 322). UTM coordinates are [REDACTED]. Site elevation is 147 masl. The crest of the dune is roughly 250 m x 300 m with a 0°-5° slope. The dune gradually slopes on the northern half at approximately 5-10°. The southern half of the dune slopes about 10°-15°. The landform drops approximately 5-10 m in all directions. The site area has a limited viewshed due to vegetation and low elevation. A large pond is approximately 50 m southeast of the landform is the closest source of water.

The ecosystem is characterized as upland moist mixed needleleaf/broadleaf forest (Figure 323). Site vegetation consists primarily of spruce and aspen with understory of moss, wild rose, high/low bush-cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface visibility is less than 5%. No disturbances were observed.

Site FAI-02090 was identified through subsurface testing. Cultural material was recovered from one of six test pits excavated. A single dark gray (4/N) chert flake fragment (UA2010-232), size class 10-20 mm, was recovered from one test pit at a depth of 10-25 cm BS. No tools were recovered.

Site stratigraphy consists of aeolian silts at least 42 cm thick overlying aeolian dune sands (Figure 324, Figure 325).

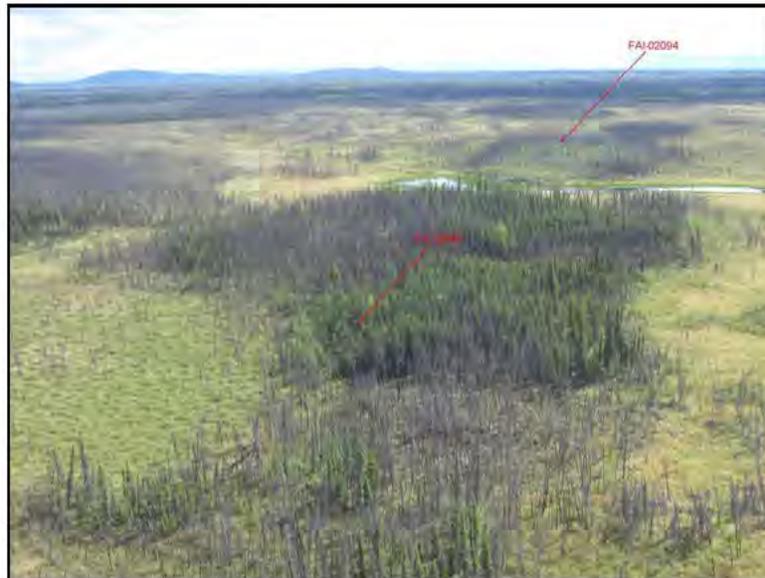

Figure 320. FAI-02090 aerial overview (view to east)

FAI-02091

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site FAI-02091 is located at the top of a southwest-northeast trending, irregularly shaped vegetated sand dune (Figure 326, Figure 327). UTM coordinates are [REDACTED]. Site elevation is 158 masl. The site is roughly 80 m x 50 m. The broad top of the dune is roughly 50 m x 80 m with a 0°-5° slope. A narrow crest, roughly 15 m x 30 m, is located on the northeast edge of the top surface of the dune and rises approximately 2 m above the rest of the dune top. The landform drops approximately 10 m in all directions and has an excellent 360° viewshed. Mount Hayes and the Alaska Range can be seen to the south with the Wood River Buttes in the foreground of the Alaska Range.

The ecosystem is characterized as upland moist mixed needleleaf/broadleaf forest (Figure 328). Site vegetation consists primarily of spruce and aspen with an understory of moss, wild rose, high/low-bush cranberry, and other low shrubs. Burned deadfall lay scattered across the dune. Surface visibility was less than 5%. No disturbances were observed.

Site FAI-02091 was identified through subsurface testing. Cultural material was recovered from two of two test pits excavated. A total of 17 flakes were recovered from depths of 0-35 cm BS (Table 59). No tools were recovered.

Site stratigraphy consists of aeolian silts at least 37 cm thick overlying aeolian dune sands (Figure 329, Figure 330).

Figure 325. FAI-02091 aerial overview (view to south)

Figure 328. FAI-02091 test pit stratigraphy

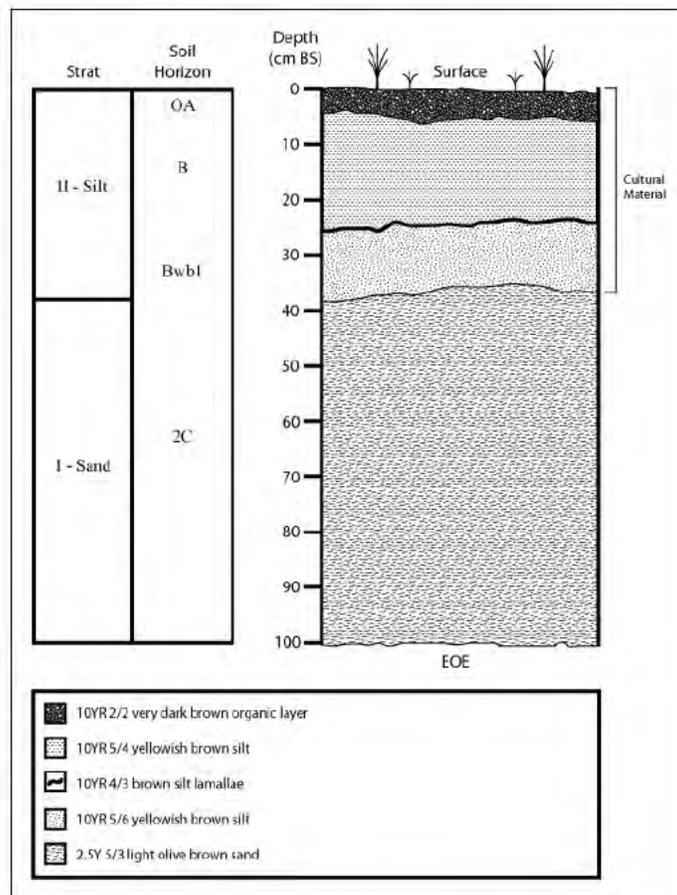

Figure 329. FAI-02091 stratigraphy

FAI-02092**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02092 is a multi-component site, with evidence of prehistoric and mid-20th century occupations, located at UTM coordinates [REDACTED] (Figure 331, Figure 332). Site elevation is 179 masl. The site is situated on an isolated vegetated sand dune, roughly 40 m x 15 m in size, trending at a 135°. The sides of the dune slope at 15-20° on all sides, dropping 2-3 m to the flats below. The prehistoric component is located on the crest of the rise, while the historic component is found on the slopes and adjacent flats.

The ecosystem is characterized as a disturbed, lowland wet needleleaf-broadleaf forest. Vegetation on the landform at the time of discovery consists of burnt spruce and aspen stumps, the result of a recent wildfire, with an understory of heavy deadfall (Figure 333). The surrounding area is a lowland wet meadow and tussock swamp with mixed burnt white and black spruce sedges, muskeg, and low shrubs.

Site FAI-02092 was found through pedestrian survey and subsurface testing. Flake stone artifacts diagnostic of a prehistoric occupation were recovered from two of two test pits excavated on the top of the dune. Nineteen flakes were recovered from depths of 0-48 cm BS (Table 60). All of these are characterized as lithic debitage made of basalt and black chert. One flake was found from an apparent depth range of 90-100 cm BS; however, at the time of discovery, it was uncertain if the artifact actually came from this or sloughed into the test pit while facing and cleaning the upper test walls.

Test pit stratigraphy consists of aeolian silts at least 75 cm thick overlying aeolian sands (Figure 334, Figure 335). Soil development consists of dark brown, very charcoal-rich burnt organic mat at 0-2 cm BS, with an underlying strong brown silt AB horizon at 2-8 cm BS, underneath which is a reddish and yellowish silt Bw horizon from 8-24 cm BS. A strong brown silt Ab horizon extends from 23-25 cm BS, underneath which is light brown silt C horizon from 24-75 cm BS. Unaltered light brown silty very fine sands (C horizon) were encountered from 75 cm BS to the end of excavation at 120 cm BS.

The historic component of the site is represented by cans and bottles indicative of a mid-20th century occupation. These were found in three distinct concentrations (“dumps” or scatters) located adjacent to the dune on its north and east sides (Figure 331). A few additional isolated cans are scattered in the vicinity. The observed cans are c-ration cans, meat cans, sanitary cans and key-open sardine cans. The bottles exhibit embossed base marks and brand marks that indicate that they date to the early 1960s. Two of the bottles are cork-stopped 750 ml liquor bottles that exhibit distinctive Owens-Illinois™ base marks that began use in 1960. These also have a mark indicating a manufacture date of 1960. The “Federal Law Prohibits Reuse of Resale” embossed lettering evident on the bases of all three recovered bottles ceased in 1964, providing a terminus ante quem date for these artifacts. The third bottle is a rectangular 750 ml bottle with embossed lettering that reads “Old Taylor.” The Old Taylor distillery ceased production in 1972, further supporting the notion of an early 1960s date. There was no evidence of features or structures found.

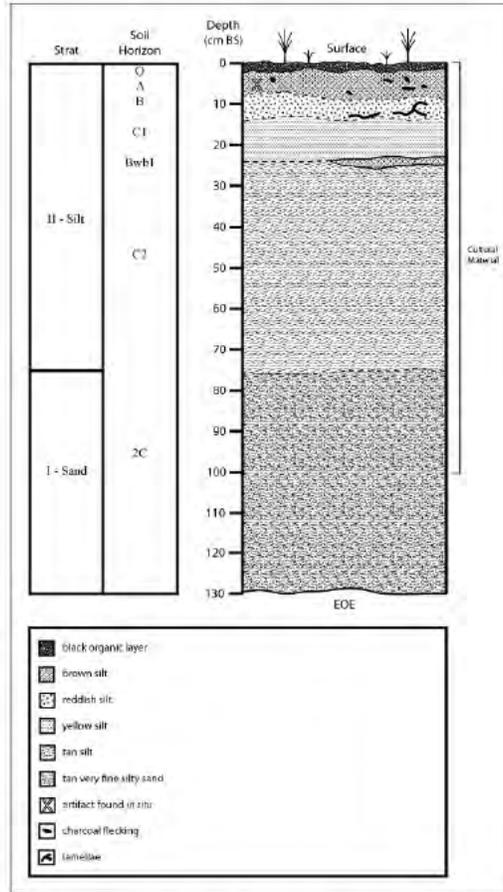

Figure 334. FAI-02092 stratigraphy

FAI-02093

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not evaluated

Site FAI-02093 is located on an isolated vegetated sand dune at UTM coordinates [REDACTED] (Figure 336, Figure 337). Site elevation is 200 masl. The landform is ovate in shape, extending roughly 40 m in a north-south direction and 15-20 m in an east-west direction. The sides of the dune slope at 15-20° on all sides, dropping 4-5 m to the flats below. The site is located on the crest of the dune, which exhibits a slope of 0-3°.

The ecosystem is characterized as a disturbed, lowland wet needleleaf-broadleaf forest (Figure 338). Vegetation on the landform at the time of discovery consists of burnt spruce and aspen stumps, the result of a recent wildfire, with an understory of heavy deadfall. The surrounding area is a lowland wet meadow and tussock swamp with mixed burnt white and black spruce sedges, muskeg, and low shrubs.

Site FAI-02093 was found through subsurface testing. Flake stone artifacts were recovered from two of three test pits excavated on the top of the dune. Six flakes were recovered from depths of 10-50 cm BS. All of these are characterized as lithic debitage made of basalt and chert (Table 61).

Test pit stratigraphy consists of aeolian silts at least 50 cm thick overlying aeolian sands (Figure 339, Figure 340). Soil development consists of a dark brown, very charcoal-rich burnt organic mat at 0-4 cm BS, with an underlying strong brown silt AB horizon at 4-18 cm BS, underneath which is a light brown silt C1 horizon from 18-24 cm BS. A reddish silt Bwb horizon extends from 24-30 cm BS. Many of the recovered artifacts seem to be associated with this Bwb horizon. An underlying yellow silt C2 horizon extends from 30-50 cm BS. Light brown, very silty fine sands are encountered from 50-70 cm BS, which in turn are underlain by light brown, very well-sorted, very fine sands encountered to the end of excavation at 120 cm BS.

FAI-02094

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not evaluated

Site FAI-02094 is located on the northern crest of a vegetated sand dune at UTM coordinates [REDACTED] (Figure 341). The dune is ovate, trending at 340°, extending roughly 300 m by 90 m, and rising 3-5 m above the surrounding terrain. Site elevation is 158 masl.

The site ecosystem is characterized as dry mixed broadleaf-needleleaf forest, while the surrounding area is characterized as a moist meadow/tussock scrub bog (Figure 342). Site vegetation consists of burnt spruce with an understory of young aspen, Labrador tea and other low scrub.

Site FAI-02094 was found through subsurface testing. A single flaked stone artifact was found at a depth of 20-30 cm BS in one of three test pits excavated. The artifact is a broken flake made of pale brown (10YR 6/3) rhyolite (UA2010-236). It is between 7.5-10 mm in size.

Site stratigraphy consists of aeolian silts 30-50 cm thick overlying very well-sorted aeolian dune sands (Figure 343, Figure 344). Soil development is characterized by typical modern O/AB horizons, with a buried Bwb horizon and clay and iron rich lamellae within the silts at 20-30 cm BS. The recovered cultural material is associated with the Bwb horizon. AMS radiocarbon dating of charcoal associated with the flaked stone artifact within the Bwb horizon yielded a date of 5620 +/-40 YBP (Beta-283347).

Figure 342. FAI-02094 test pit stratigraphy

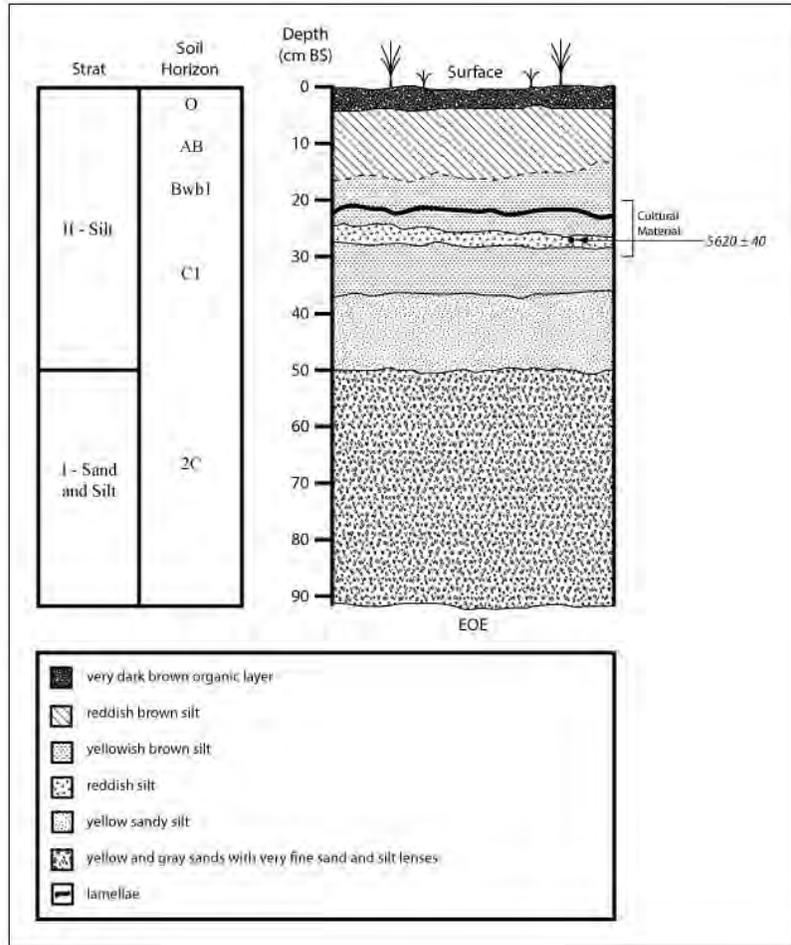

Figure 343. FAI-02094 stratigraphy

FAI-02097

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: not evaluated

Site FAI-02097 is located on a low stabilized dune in the relatively featureless expanse of the Tanana Flats roughly 13 km southeast of the Wood River Buttes, 30 km west of the Blair Lakes, and 150 m east of the Bonnifield Trail. UTM coordinates are [REDACTED]. Site elevation is 211 masl. The dune is linear in shape, extending more than 250 m north-south, and more than 60 m east-west. It rises roughly 1 m from the surrounding flat landscape. The area was burned in a forest fire during 2009.

Site ecosystem is characterized a lowland disturbed (burnt) needleleaf forest with vegetation consisting of burnt black spruce and scattered shrubs and grasses. The surrounding area is a

muskeg bog. Discontinuous patches of bare sand and silt—the results of devegetation due to fire disturbance—are common, comprising roughly 25% of the overall landform surface. A single flake fragment, 20-30 mm in diameter, made of pale brown (10YR 6/3) rhyolite (UA2010-238), was found on the surface of one of these areas of surface exposure roughly in the middle of the dune. The flake is blackened at one end, oxidized and burnt, likely from the recent wildfire.

The site was discovered in late autumn by an off-duty seasonal archaeological technician. As such, no photos were taken, no test pits were excavated, and no site map was drawn. Site location and provenience, however, are reliable as a Garmin handheld GPS was available at the time of artifact discovery. The data adds to the growing body of evidence of prehistoric land use of stabilized dune features in the Tanana Flats. Unfortunately, these are the limits of our current knowledge about this particular site.

4.3.3 Bedrock Knolls

These efforts resulted in the identification of one new prehistoric archaeological site in 2010 (Figure 345).

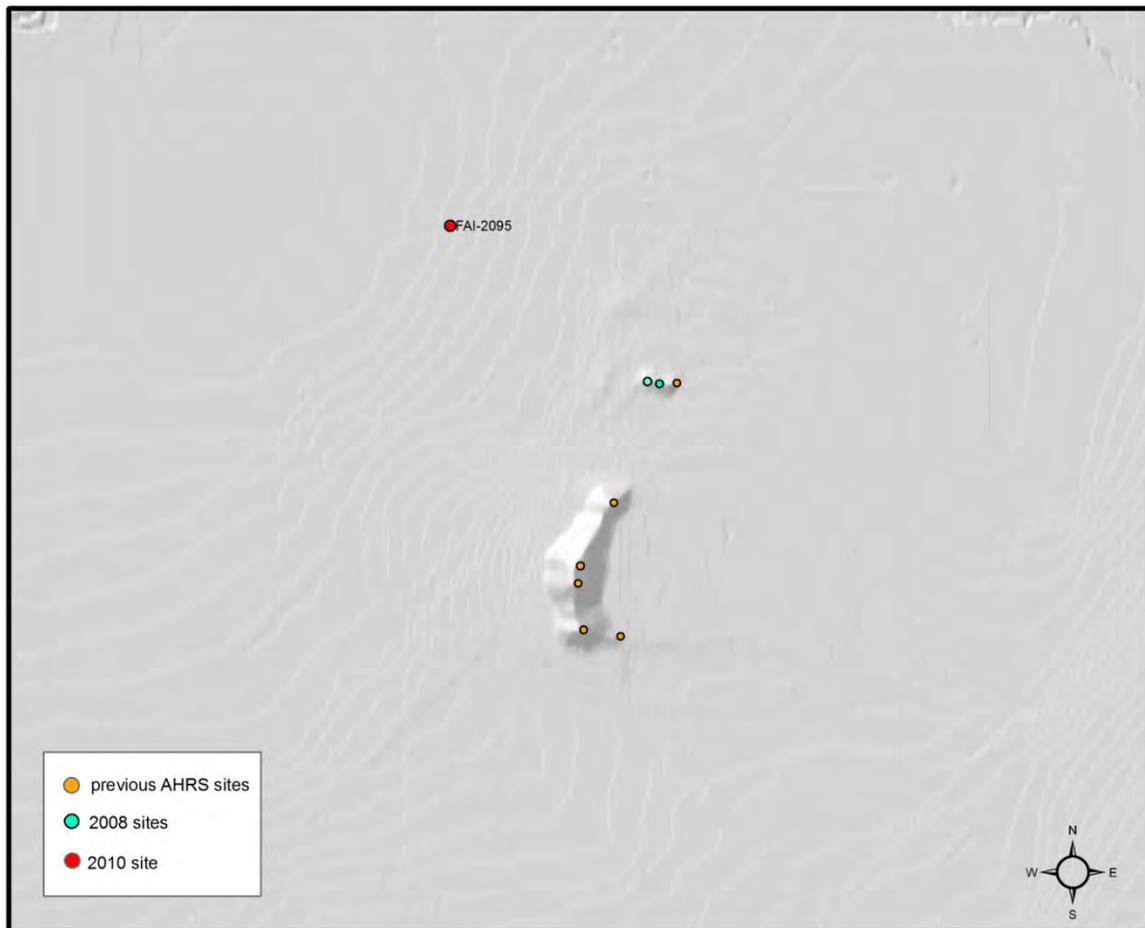

Figure 344. Bedrock knolls and site FAI-02095

FAI-02095**Latitude:** [REDACTED]**Longitude:** [REDACTED]**Determination of Eligibility:** Not evaluated

Site FAI-02095 is located on the crest of a low hill at UTM coordinates [REDACTED] (Figure 346, Figure 347). The landform is a bedrock knoll that extends roughly 400 m x 110 m at a 300° bearing. The positive test pits leading to site discovery are located on the northeastern edge of the hill in an area with a 0-3° slope. The edge of the landform drops steeply, roughly 20-25 m to the flats below. A modern hunting camp with meat poles and lumber frame for a wall tent sits on the site area, but with the exception of a modern privy, there is minimal ground disturbance or associated surface visibility.

The ecotype is characterized as a dry needleleaf forest (Figure 348). Vegetation primarily consists of large white spruce with some scattered birch and an understory of rosehips and other forbs.

Site FAI-02095 was found through subsurface testing. Cultural material was found in three of three test pits excavated. Sixty lithics artifacts, all of which are characterized as lithic debitage were recovered from depths of 0-35 cm BS. An additional piece of flaked stone debitage was found at a depth range of 45-55 cm BS (Table 62). Four pieces of calcined bone were recovered from depths of 18-25 cm BS. These are very small fragments, between 5-12 mm in diameter, unidentifiable to species or element, although they do resemble fragmented medium to large mammal bones. Their entirely calcined nature and association with flaked stone artifacts supports the idea that they are of cultural origin and possibly suggest the presence of a hearth feature in the vicinity.

Stratigraphy consists of very compacted aeolian silts, more than a meter thick, overlying Birch Creek schist bedrock (Figure 349, Figure 350). Soil development is characterized by typical surface O/AB horizons, with a buried Bwb horizon and associated clay and iron rich lamellae at 15-25 cm BS. The silts from 25-100 cm BS are an unaltered C horizon.

5.0 DYKE RANGE

5.1 Introduction

The FWA Dyke Range consists of approximately 3,375 acres of land (Figure 351) located on the northeast side of TFTA, south of the city of North Pole. The majority of the training area lies in the Tanana River floodplain, but a small portion of the range is located on a terrace to the northeast. The area is located in the Tanana-Kuskokwim lowlands (Wahrhaftig 1965) and is mainly composed of recent alluvium. Higher landforms are capped by a thin mantle of aeolian silt (loess).

The area contains three main vegetation types: treeless bogs, open low-growing spruce forests, and closed spruce-hardwood forests. Forests in the Dyke Range include black spruce in low, poorly-drained areas and spruce and mixed hardwood (poplar, birch, and aspen) in upland areas.

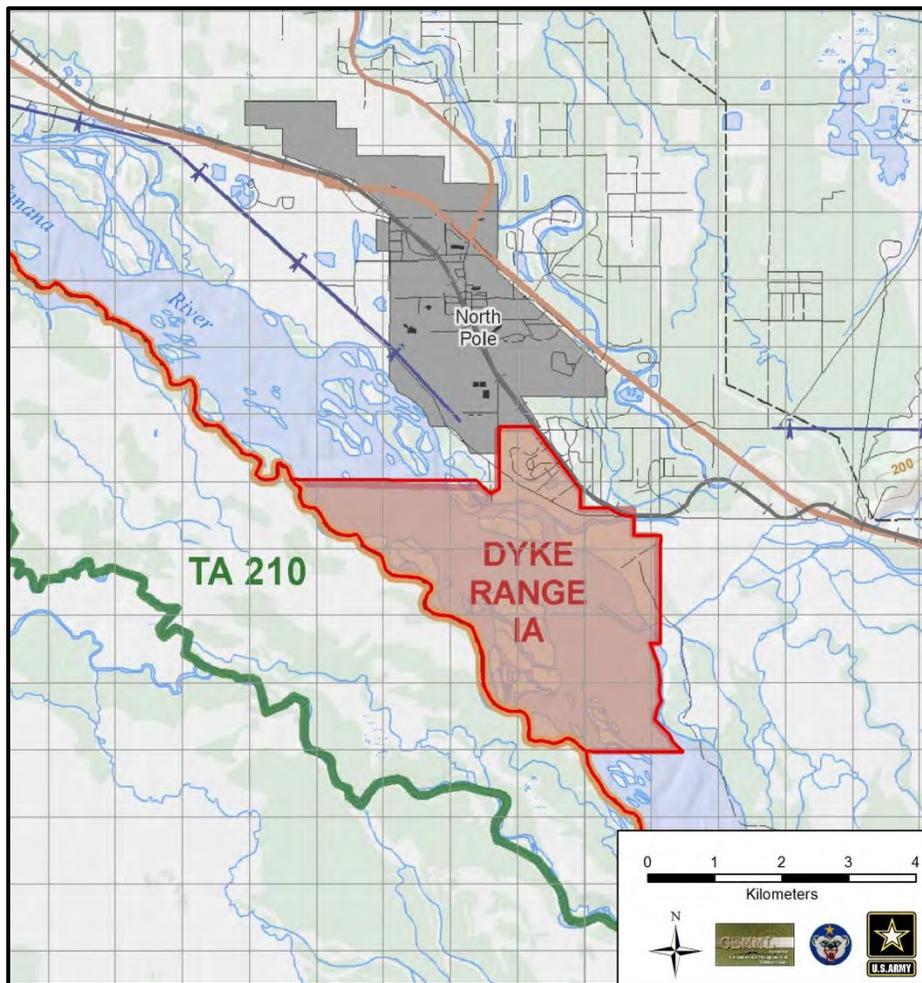

Figure 350. Dyke Range

5.2 Dyke Range Surveys

Twenty acres of land in the Dyke Range were surveyed in 2011 for a Section 106 project (Figure 352). Pedestrian surveys at 20-m intervals covered the entire area intended to be open for a public timber sale. No archaeological sites were discovered during the survey. The Dyke Range has not been surveyed by CEMML in the past, and the area within the active floodplain will not be surveyed for archaeological sites.

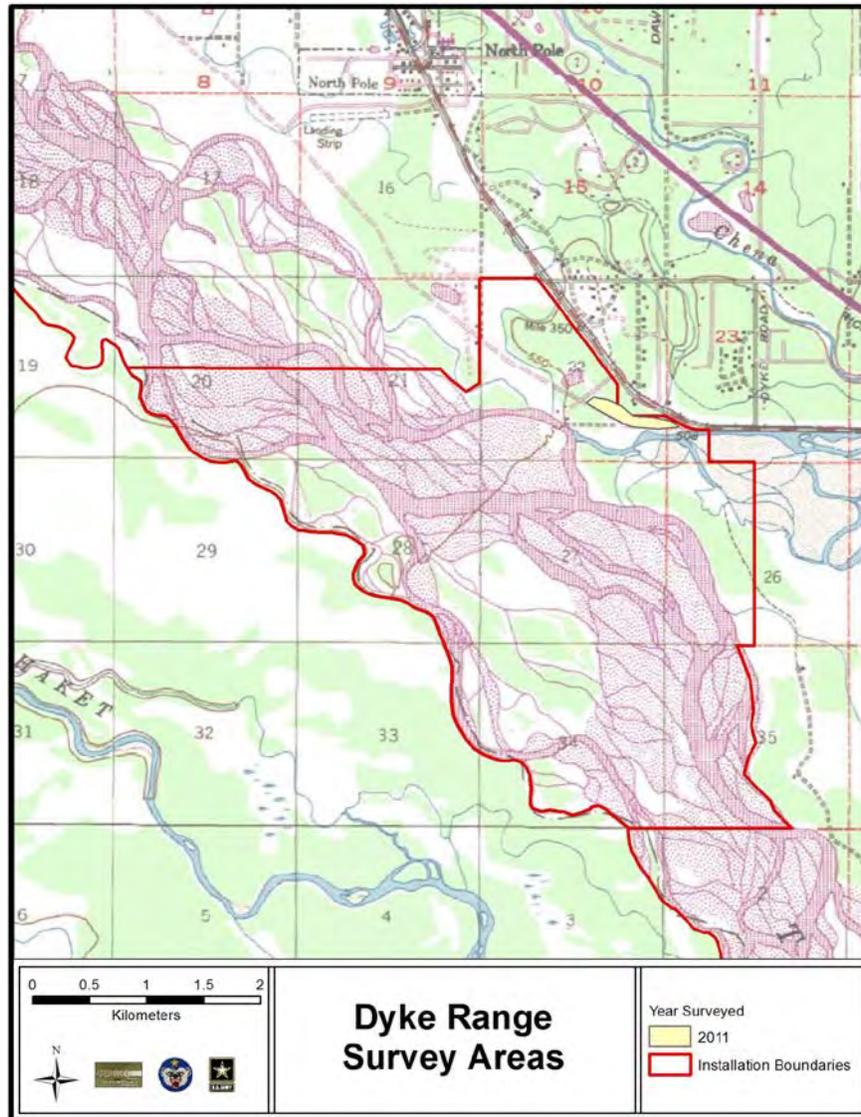

Figure 351. Dyke Range survey areas by year

5.3 Dyke Range Archaeological Sites

No archaeological sites are known from the Dyke Range.

6.0 DONNELLY TRAINING AREA (DTA)

6.1 Introduction

DTA encompasses approximately 634,530 acres of land north of the Alaska Range, in the Tanana River watershed (Figure 353). It is part of the Intermontane Plateaus physiographic region of Alaska. The terrain is characterized by round, even-topped, west to east oriented ridges that rise above adjacent valley floors to an elevation of 600-1500 m above sea level (masl). The surface topography has been carved by multiple glacial events and subdued further by the addition of moraine and outwash (Pink 2005). The southern half of the West Training Area primarily lies within the Northern Foothills of the Alaska Range. The foothills are largely unglaciated, but past glaciations widened valleys, and valley glaciers extend onto the installation in the southwestern portion of the training area.

Bedrock is primarily composed of Precambrian schist overlain by Cretaceous granites and Tertiary volcanic rocks. The volcanic rocks were an important raw material source for prehistoric peoples living in this area. Glacial moraine and alluvial outwash fans are among the most common surface sediments (Holmes 1965). The parent materials for soils in DTA are glacial in origin, so profiles typically contain an organic layer above loess above till (Natural Resource Conservation Service 2010).

DTA lies within the Tanana River drainage basin. Surface waters from DTA East drain into the Delta River and Jarvis, Granite, and Ober creeks. DTA West drains into the Delta River, Little Delta River, and Buchanan Creek, which all drain into the Tanana River. Streams are fed by glacial meltwater from the Alaska Range. Water flow is greatest during June and July when snow and glacial melt has passed its peak. The numerous rivers, streams, ponds, and lakes in DTA attract animals today and attracted people in the past. Archaeological sites are numerous around ponds and on river bluffs.

Five vegetation types are found in DTA: moist tundra; treeless bogs and fens; open, low growing spruce forests; closed hardwood spruce forests; and the white spruce-paper birch forest of Interior Alaska, called the boreal forest or taiga. Vegetation types of Interior Alaska form a mosaic and reflect fire history, slope, aspect, and presence or absence of permafrost (Viereck and Little 1972). A floristic study of Donnelly Training Area conducted in 1997 identified 497 plant species, 17 of which were considered rare (Racine et al. 1997). Almost 21,000 acres of spruce-poplar forest exist in DTA (Tanana Chiefs Conference 1993). Local floral species traditionally used by Athabascan people for food include bog blueberry and cranberry, currant, birch mushroom, Hudson Bay tea, lambsquarter, pea-vine root, raspberry, rosehips, salmonberry and wild rhubarb (Haynes and Simone 2007).

Wildlife in the area is significant for both modern and prehistoric hunters. The large game species found in DTA include moose, caribou (in DTA West), bison, and Dall sheep (Molybdenum Ridge area of DTA West). Caribou calving grounds are located in DTA West, and bison were introduced to the region in 1928 after being eradicated from the area approximately 450-500 years ago. Small game species in the area that would have attracted people include ptarmigan, grouse, swans, ducks, geese, cranes, coyote, wolf, lynx, red squirrel, snowshoe hare, marten, beaver, otter, wolverine, red fox, porcupine and mink (INRMP 2007).

The Delta River is an important fall chum salmon and Coho spawning habitat, and all major streams support Arctic grayling (Bureau of Land Management and U.S. Army 1994). Ethnographic data from Athabascan subsistence patterns suggests that many key seasonal resources were utilized in the Upper Tanana Basin, and many are currently available in DTA. The Athabascan settlement system included spring and early summer fishing (e.g., grayling, Burbot, Chinook, Coho, lake trout, Sockeye salmon), summer caribou and moose hunting, autumn caribou hunting, and winter trapping (beaver, ermine, lynx, marten, mink, muskrat, porcupine, and hare) (Haynes and Simeone 2007).

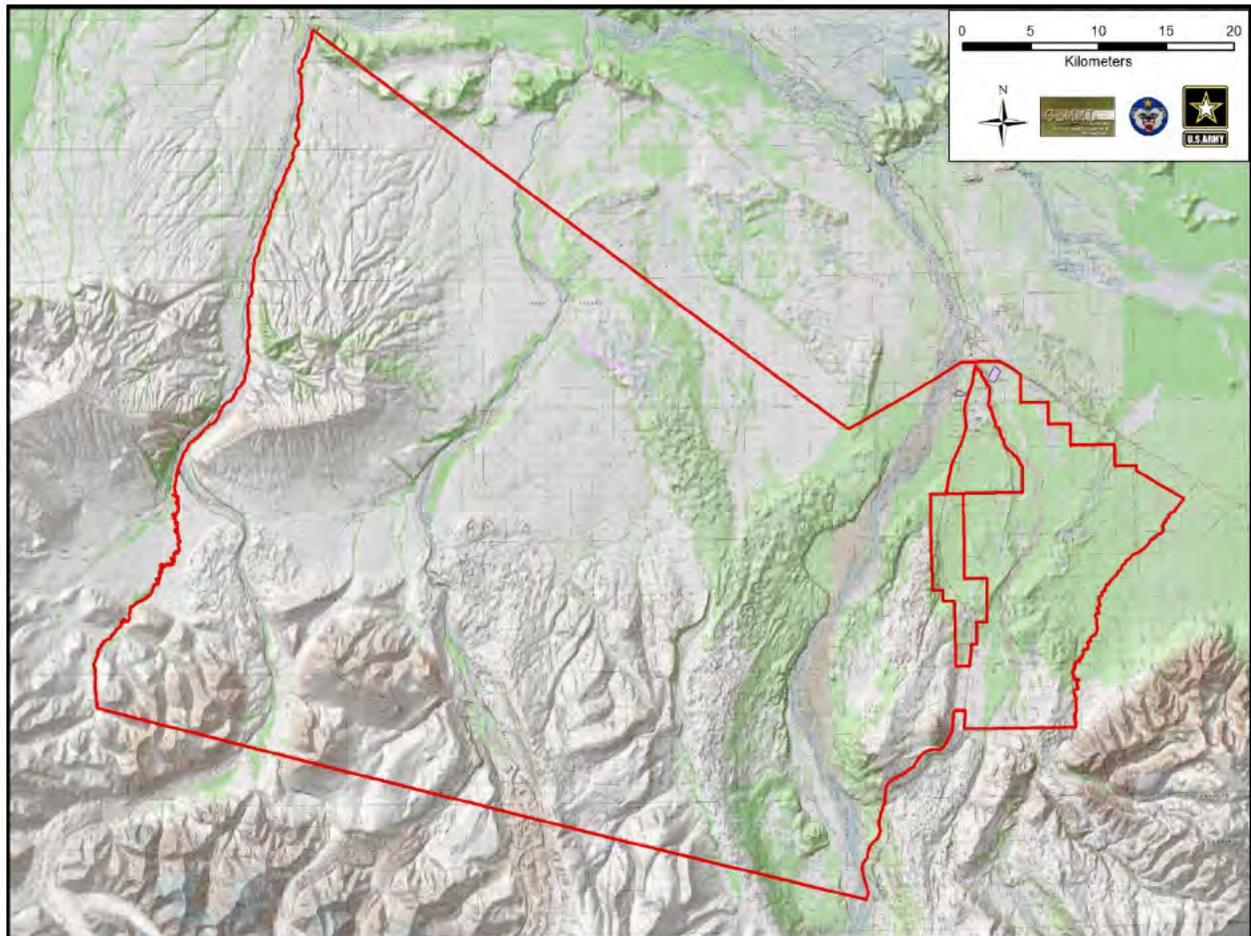

Figure 352. DTA

6.2 DTA Surveys

Archaeological surveys in DTA have generally been guided by Section 106 undertaking (Figure 354, Figure 355). Road and trail maintenance and expansion and the development of timber sales areas were the most common projects in 2011. Large areas of the eastern area of DTA were also surveyed for the Cold Regions Test Center (CRTC), a tenant of FWA (Esdaile et al. 2012). Section 110 survey of portions of the Molybdenum Ridge area of DTA West also took place in 2011.

Survey areas for Section 106 undertakings in 2011 included: Buffalo Drop Zone expansion and timber sales, Lampkin Range expansion, and 33-Mile Loop connector trail development (also called Granite Creek Trail) (all SHPO letter 8/30/11); 33-Mile Loop trail maintenance and FGA Airport Approach timber sales areas (SHPO letter 11/22/11); and Washington Range, OP Road from 4-6a, the Direct Fire Line, and the OP 12 Access Road for CRTC (Esdale et al. 2012).

Survey areas for Section 110 inventory in 2010 were restricted to Hillbilly Hill in DTA West and the Excalibur target location on a hill top west of the Delta River (Espenshade 2010). In 2011, CEMML crews, under the direction of Julie Esdale, investigated over 2,000 acres in upland areas in the Molybdenum Ridge area of DTA West, 120 acres along OPs 1-12 in DTA East, and 303 acres along portions of the trail leading from the OP Road in DTA East to OP 26 in DTA West (see Figure 354).

Future research in DTA will be concentrated on filling in areas of DTA East that have not yet been surveyed and on a road corridor in DTA West leading from OP 26 to Molybdenum Ridge.

6.3 DTA Sites

At present, 455 archaeological sites are known from DTA (Table 63, Table 64, Figure 356, Figure 357). Six of these sites are historic and 449 are prehistoric. Forty-nine sites are eligible for the NRHP. Fifty sites have been determined not eligible, and 356 sites have yet to be evaluated. Twenty-seven sites were discovered during 2011 surveys in the training area. Six sites were found during the CRTC surveys of DTA East and 21 new sites were located during the Molybdenum Ridge survey. All of these sites are described in this document, although the sites found during the CRTC survey are also described in the 2012 report titled “2011 Archaeological Survey and Report of CRTC Project Areas in Donnelly Training Area for the Cold Regions Test Center” by Julie Esdale, James Quinn, Kate Yeske, and Whitney McLaren.

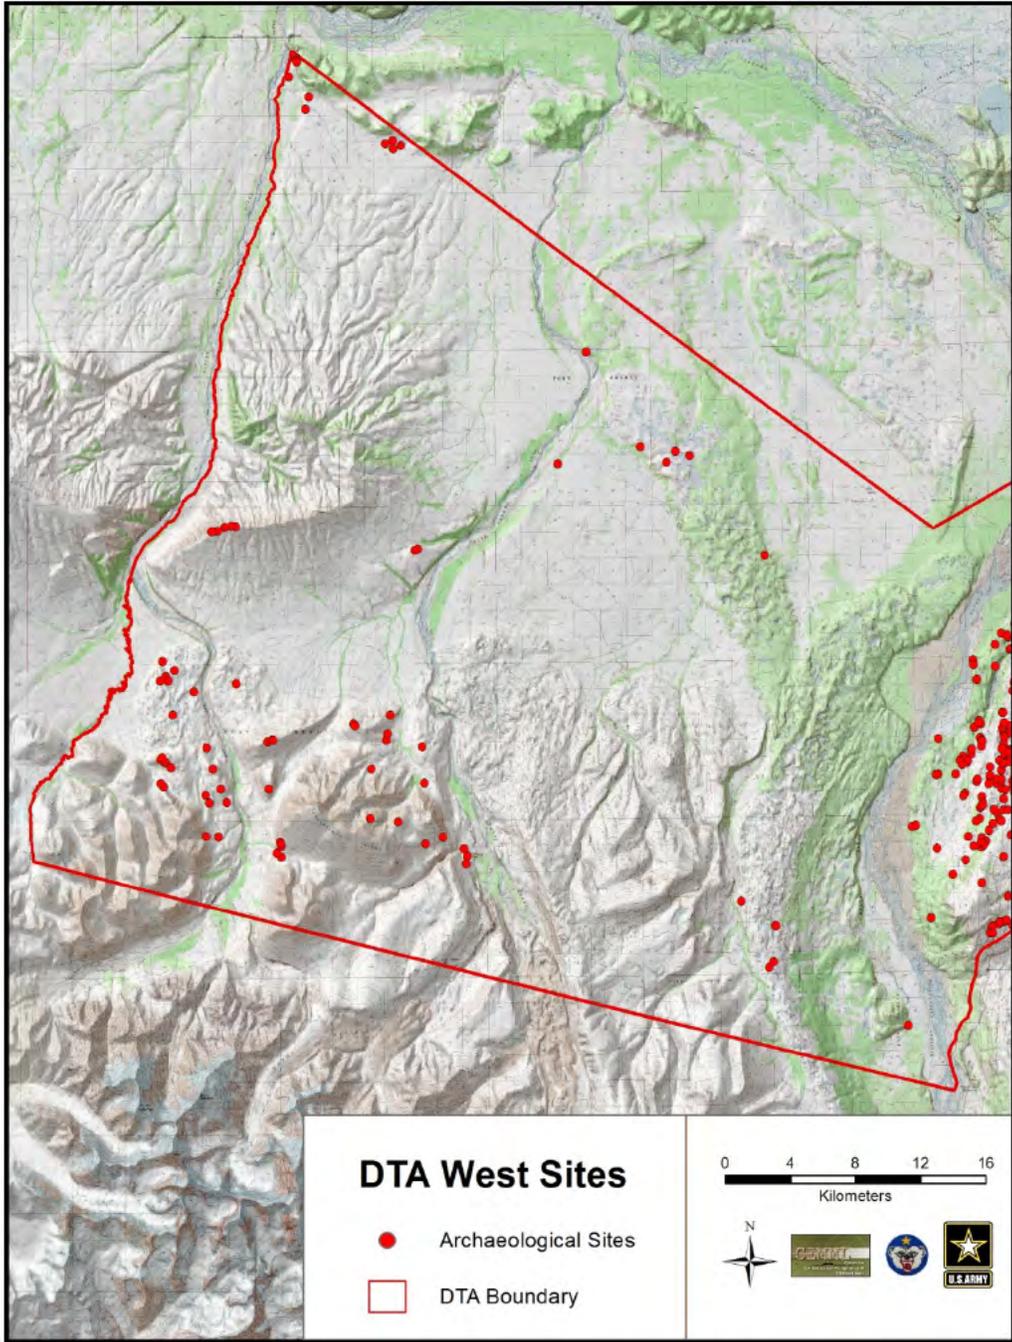

Figure 355. Location of sites within DTA West

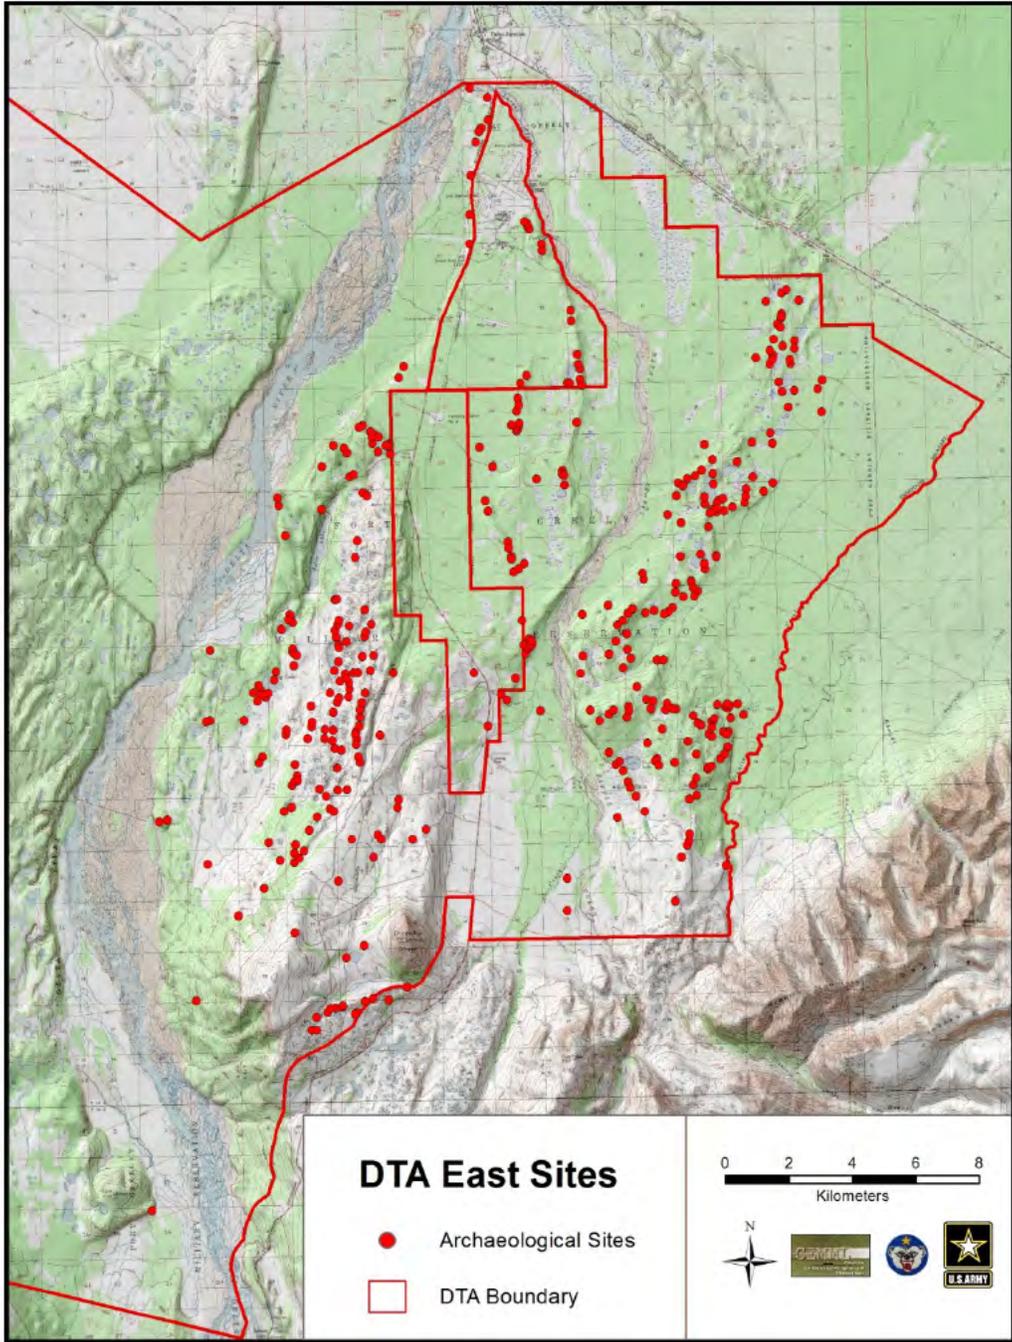

Figure 356. Location of sites within DTA East

6.3.1 DTA East Sites

Six sites were found in DTA East during the 2011 field season (Figure 358).

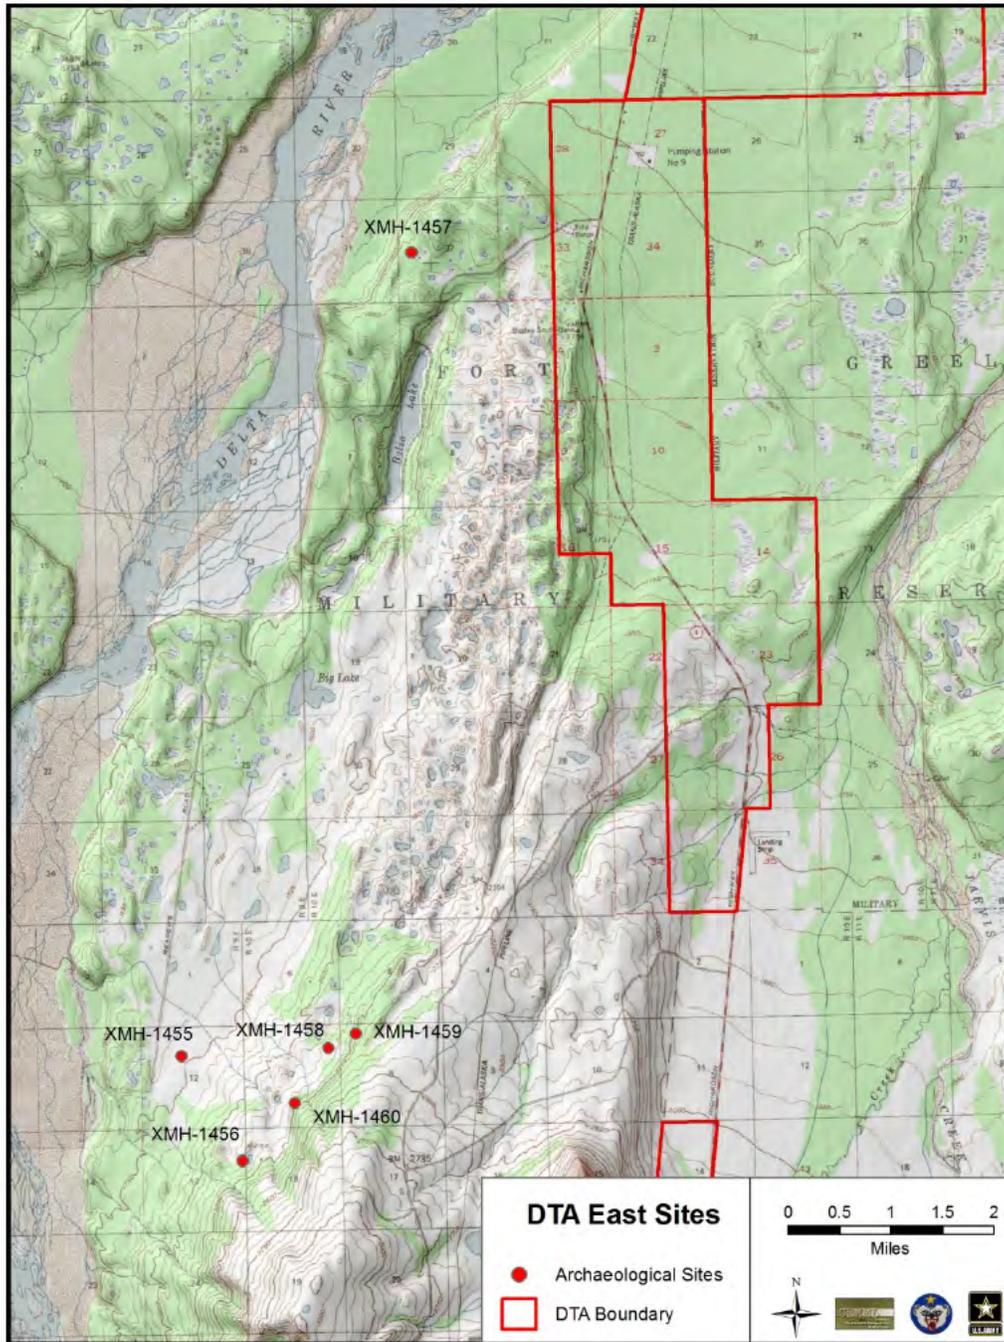

Figure 357. Location of 2011 sites in DTA East

XMH-01455

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-1455 is located on an east-west trending knoll that overlooks the Delta River 1.5 km to the west (Figure 359, Figure 360). UTM Coordinates are [REDACTED], 543 masl. The site is approximately 7 km northwest of the summit of Donnelly Dome. The nearest water source is a small unnamed lake 0.5km to the west. The viewshed at the site is 180° to the west.

The vegetation ecotype can be characterized as upland moist, low and tall scrub (Figure 361). It consists of an over-story dominated by spruce, aspen, birch, and tamarack. Understory vegetation includes low and tall scrub. Ground cover is dense in areas not exhibiting erosional exposures. Surface visibility at the site is estimated to be 5%. The topsoil at this site was thin (3 cm) due to erosion, and sediments consisted of unstratified aeolian silts above glacial till at 46 cm BS (Figure 362).

Six gray chert flake fragments, including three linear flakes, and one basalt flake were found at this site. Two gray chert fragments and one basalt flake were recorded on the surface, and four gray chert flake fragments were recovered in one of three shovel test excavations (AT-1), 5-20 cm below surface (Table 65, Figure 363). The linear flakes may be indicative of early stage microblade core reduction. The forms are general, however, and cannot be attributed to any specific archaeological culture. No organic remains were found with the artifacts for radiocarbon dating, and the shallow glacial debris and compressed stratigraphy prevent dating of this site at this time.

XMH-01456

Latitude: [REDACTED]

Longitude: [REDACTED] (NAD 83)

Determination of Eligibility: Not Evaluated

Site XMH-1456 is located on an east-west trending knoll that overlooks the Delta River 2.5 km to the west (Figure 364, Figure 365). UTM coordinates are [REDACTED], 689 masl. The site is approximately 5.5 km west of the summit of Donnelly Dome. The nearest water source is a small unnamed lake 50 m to east. The viewshed at the site is 180° to the west. Visible landmarks include the Alaska Range to the southwest and Bolio Lake to the northwest.

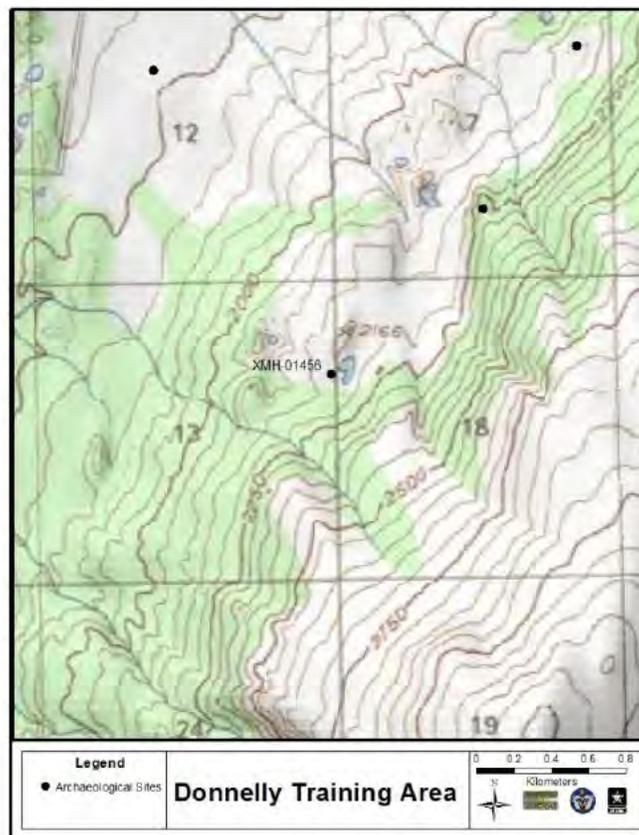

Figure 363. Location of XMH-10456

The vegetation at the site can be characterized as upland moist low and tall scrub. It consists of an over-story dominated by spruce, aspen, birch, and tamarack (Figure 366). Understory vegetation includes low and tall scrub. Ground cover is dense in areas not exhibiting erosional exposures. Surface visibility at the site is estimated to be 25%. A deep (20 cm) root mat at the site overlies 20 cm of dark brown, mixed silt and gravels, which overlie coarser gravels and rocks (glacial deposits) (Figure 367, Figure 368).

One black chert uniface fragment was discovered in the upper 20 cm of one of three shovel tests (AT-59) (Table 66, Figure 369). The artifact found in this test pit was a small, black chert scraper fragment. The endscraper was made on a flake and had measurements of 22.1 mm long, 21.7 mm wide, and 8.7 mm thick. The form is generic and cannot be attributed to any particular archaeological time period based on morphological data. No organic remains were found with the artifacts for radiocarbon dating, and the shallow glacial debris and compressed stratigraphy prevent dating of this site at this time.

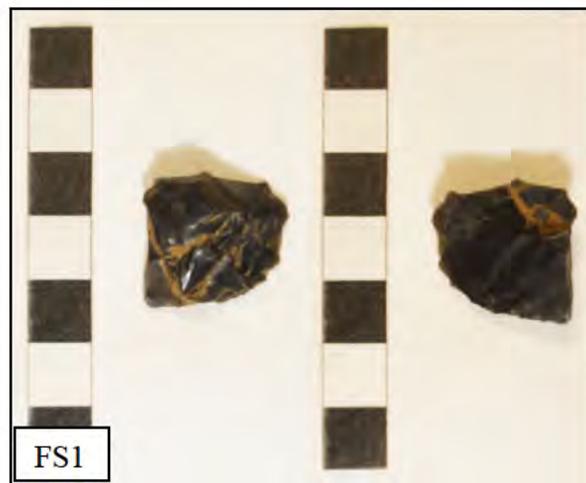

Figure 368. Scraper from XMH-01456

XMH-01457

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-1457 is located on a high knoll on the west side of OP Road, 1 km east of the Delta River and 1 km west of Meadows Road (Figure 370, Figure 371). UTM coordinates are [REDACTED], 499 masl. The nearest water source is an unnamed lake 500 m to the southeast. The viewshed at the site is 360°. Visible landmarks include the Delta River to the north and west, the Granite Mountains to the southeast, and the Alaska Range to the southwest. Surface visibility is estimated to be 95%.

The vegetation surrounding the site can be characterized as upland dry broadleaf forest, although much of the vegetation right on site has been disturbed by military activity (Figure 372). Small birch, alder, and dead spruce are found around the site. Patchy moss is found across the site.

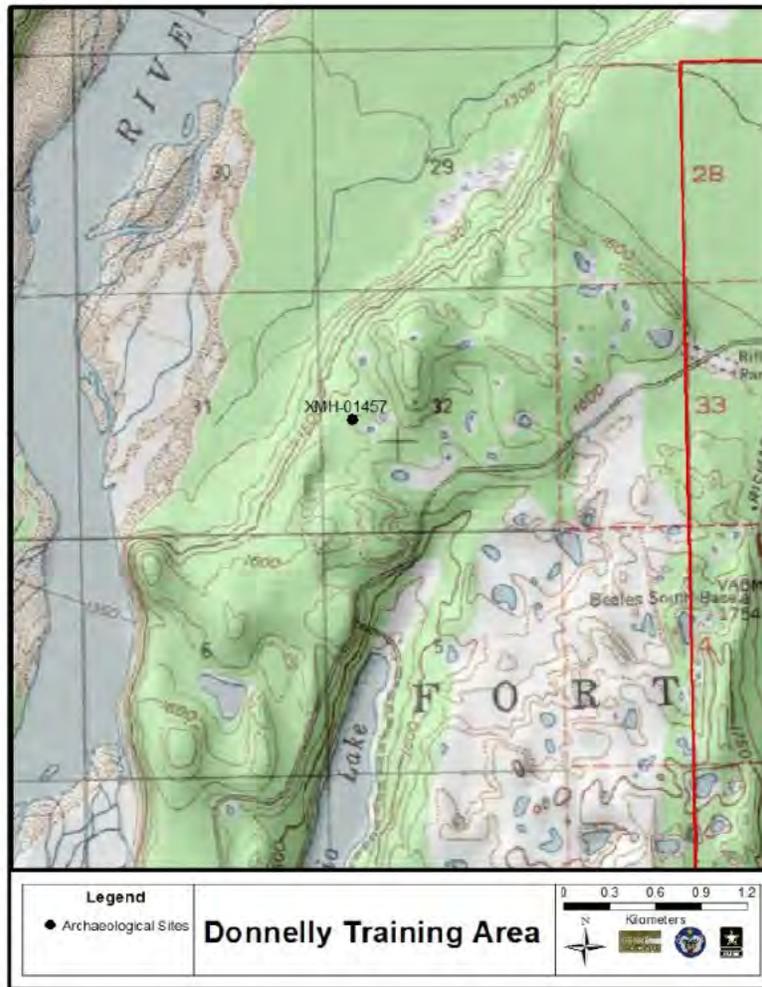

Figure 369. Location of XMH-01457

No shovel tests were excavated at this location. Two bifaces were found adjacent to each other on the surface of the site. Both bifaces were fragmentary. The first was an early-stage blank fragment made from gray chert (40.6 mm long, 32.9 mm wide, and 11.4 mm thick) and the second is a beige argillite projectile point fragment (29.2 mm long, 25.4 mm wide, and 8.1 mm thick) (Table 67, Figure 373). Both bifaces have a generalized lanceolate morphology and cannot be attributed to any particular archaeological time period based on formal data. No organic remains were found with the artifacts for radiocarbon dating, and the site age cannot be established at this time.

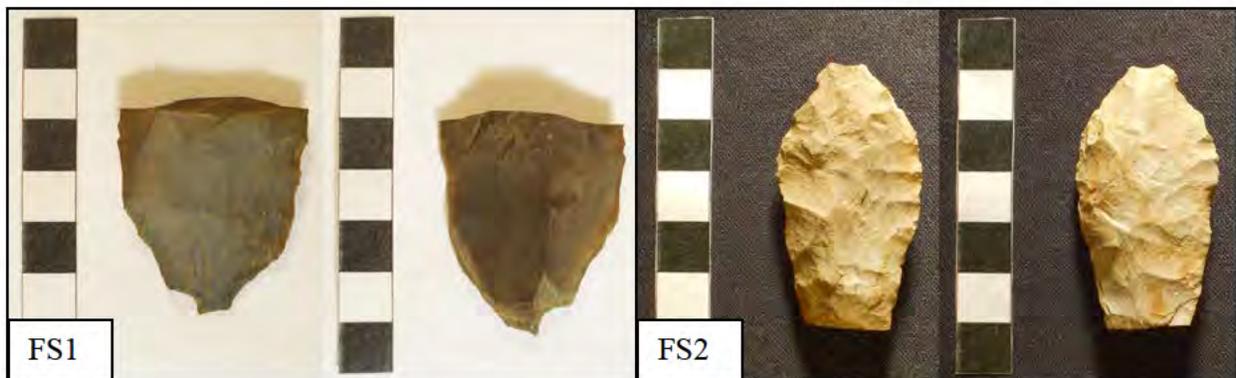

Figure 372. Bifaces from XMH-01457

XMH-01458

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-1458 is located at the base of a small knoll with a long north-south trending ridge, 3.5 km east of the Delta River and 4.5 km west of the summit of Donnelly Dome (Figure 374, Figure 375). UTM coordinates are [REDACTED], 689 masl. The nearest water source is a small unnamed lake 120 m to the west. The viewshed at the site is 360°.

Vegetation at the site can be characterized as alpine wet-low scrub consisting of small willows, moss, lichen, and grass (Figure 376). Ground cover is dense in areas not exhibiting erosional exposures. Surface visibility at the site is estimated to be 25%. Two test pits excavated at the site show a root mat covering 5-10 cm of wind-blown dark grayish brown silt, over 25-40 cm of additional dark yellowish brown silt, over glacial till. The silt gets sandier deeper in the profile.

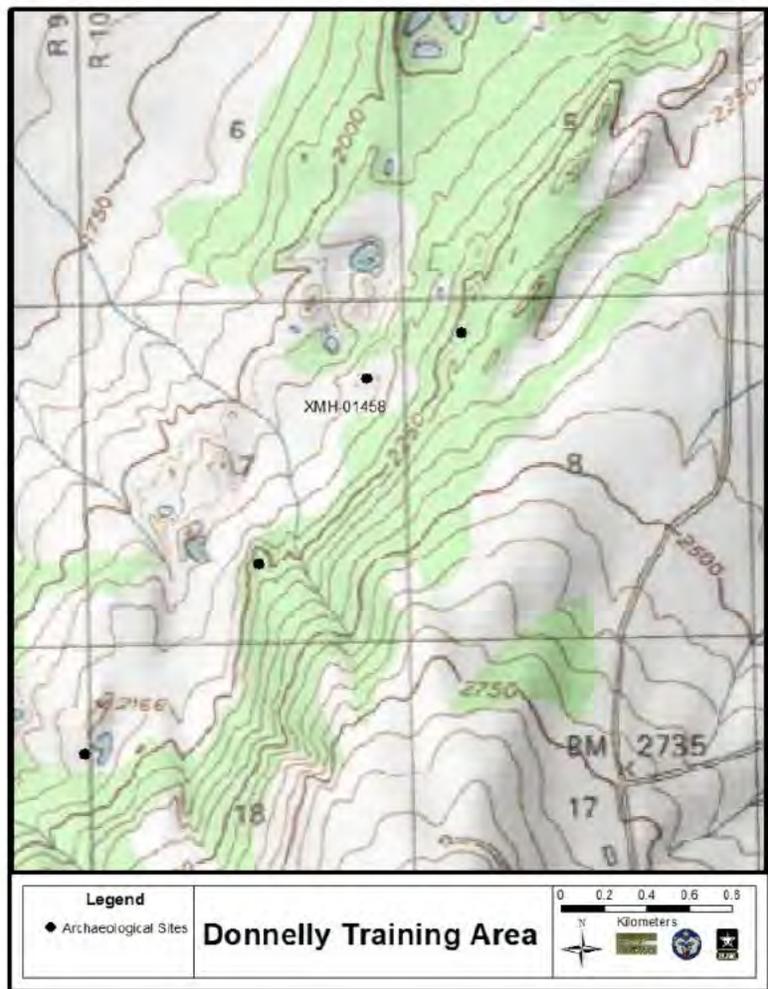

Figure 373. Location of XMH-01458

One black chert flake fragment was found in an exposed area on the surface of the site (Table 68, Figure 377). No other flakes were discovered on the surface or in any of the seven test pits excavated in the area. The form is generic and cannot be attributed to any particular archaeological time period based on morphological data. No organic remains were found with the artifacts for radiocarbon dating, and the shallow glacial debris and compressed stratigraphy prevent dating of this site at this time.

Figure 376. Flake from XMH-01458

XMH-01459

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-1459 is located on a small knoll surrounded on the north, east, and south by larger knolls and ridges (Figure 378, Figure 379). UTM coordinates are [REDACTED], 707 masl. The Delta River is 4 km to the west and the summit of Donnelly Dome is 4.5 km to the east of the site. The nearest water source is a small unnamed lake at a higher elevation, 650 m to the west. The viewshed at the site is 360° but blocked in places by surrounding landforms. Visible landmarks include two small lakes to the west and northwest and Donnelly Ridge to the east.

Vegetation at the site can be characterized as alpine low scrub, consisting of small willows, moss, lichen and grass (Figure 380). Ground covering is dense and surface visibility is only 2%. Test pits show a stratigraphy composed of a thick root mat overlying 6 cm of dark gray silt loam over 20 cm of dark yellowish gray (Figure 381, Figure 382). The silt tops glacial gravels at approximately 27 cm below surface.

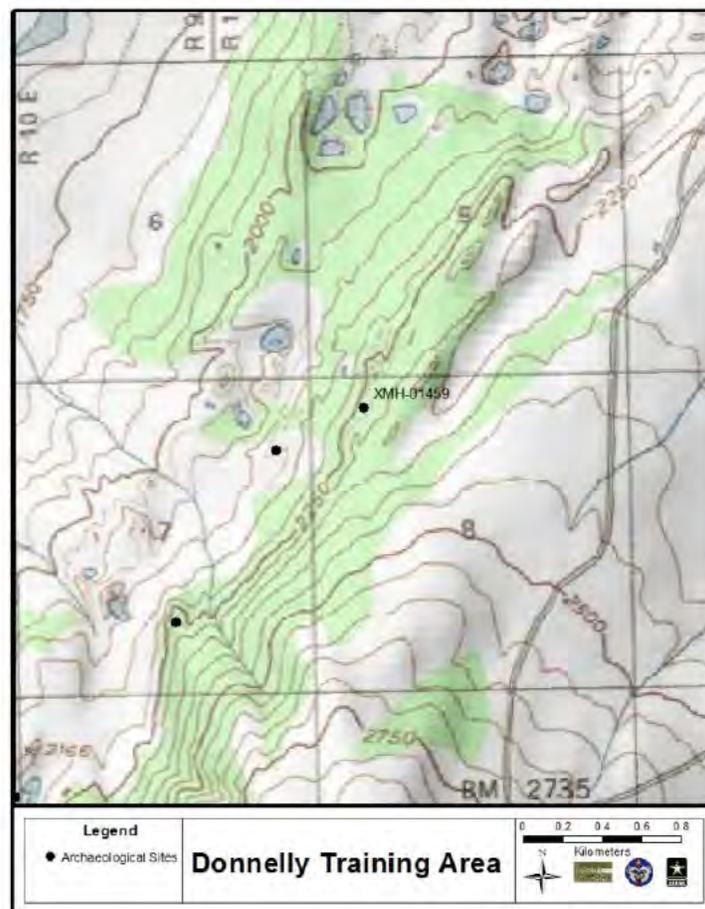

Figure 377. Location of XMH-01459

One broken black basalt flake fragment was found shallowly buried in test pit BT-383 (Table 69, Figure 383). No other flakes were discovered on the surface or in either of the two test pits excavated in the area. The form is generic and cannot be attributed to any particular archaeological time period based on morphological data. No organic remains were found with the artifacts for radiocarbon dating, and the shallow glacial debris and compressed stratigraphy prevent dating of this site at this time.

Figure 382. Flake from XMH-01459

XMH-01460

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-1460 is located on a high knoll 3 km east of the Delta River and 5 km west of the summit of Donnelly Dome (Figure 384). UTM coordinates are [REDACTED], 717 masl. The nearest water source is a small unnamed lake approximately 250 m down slope to the west. The viewshed at the site is 360°. Visible landmarks include two small lakes to the west and a north-south trending ridge to the east.

Vegetation can be characterized as alpine wet low-scrub and consists of small willows, moss, lichen, and grass (Figure 385). Ground cover is dense where no erosion has occurred. Surface visibility at the site is approximately 30%. Shrapnel and other debris were evident from past military use of the landform.

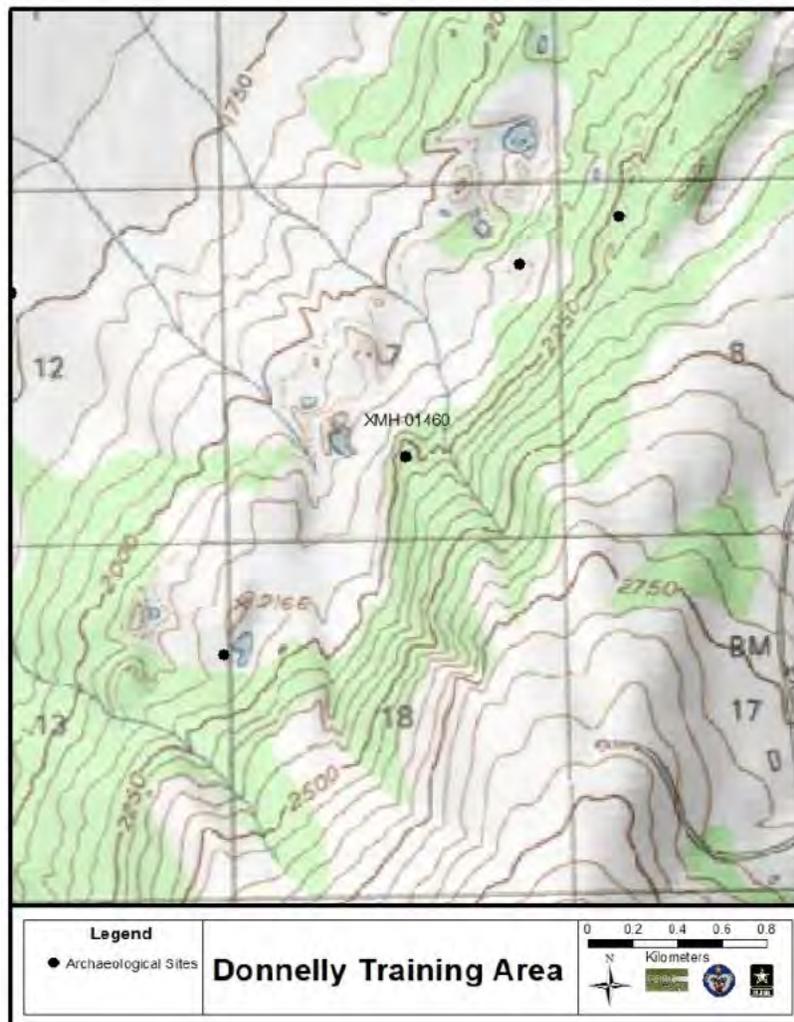

Figure 383. Location of XMH-01460

Figure 384. Vegetation at XMH-01460

One artifact, a beige chert endscraper, was found on the surface of the landform (Table 70, Figure 386). The scraper was made on the proximal end of a broken flake and measured 25.6 mm long, 22.4 mm wide, and 8.3 mm thick. No other flakes were discovered on the surface or in any of the 19 test pits excavated in the area. The scraper form is generic and cannot be attributed to any particular archaeological time period based on morphological data. No organic remains were found with the artifacts for radiocarbon dating, and the site age cannot be established at this time.

6.3.2 Molybdenum Ridge Sites

Twenty-one sites were discovered during the 2011 survey in the Molybdenum Ridge Area (Figure 387).

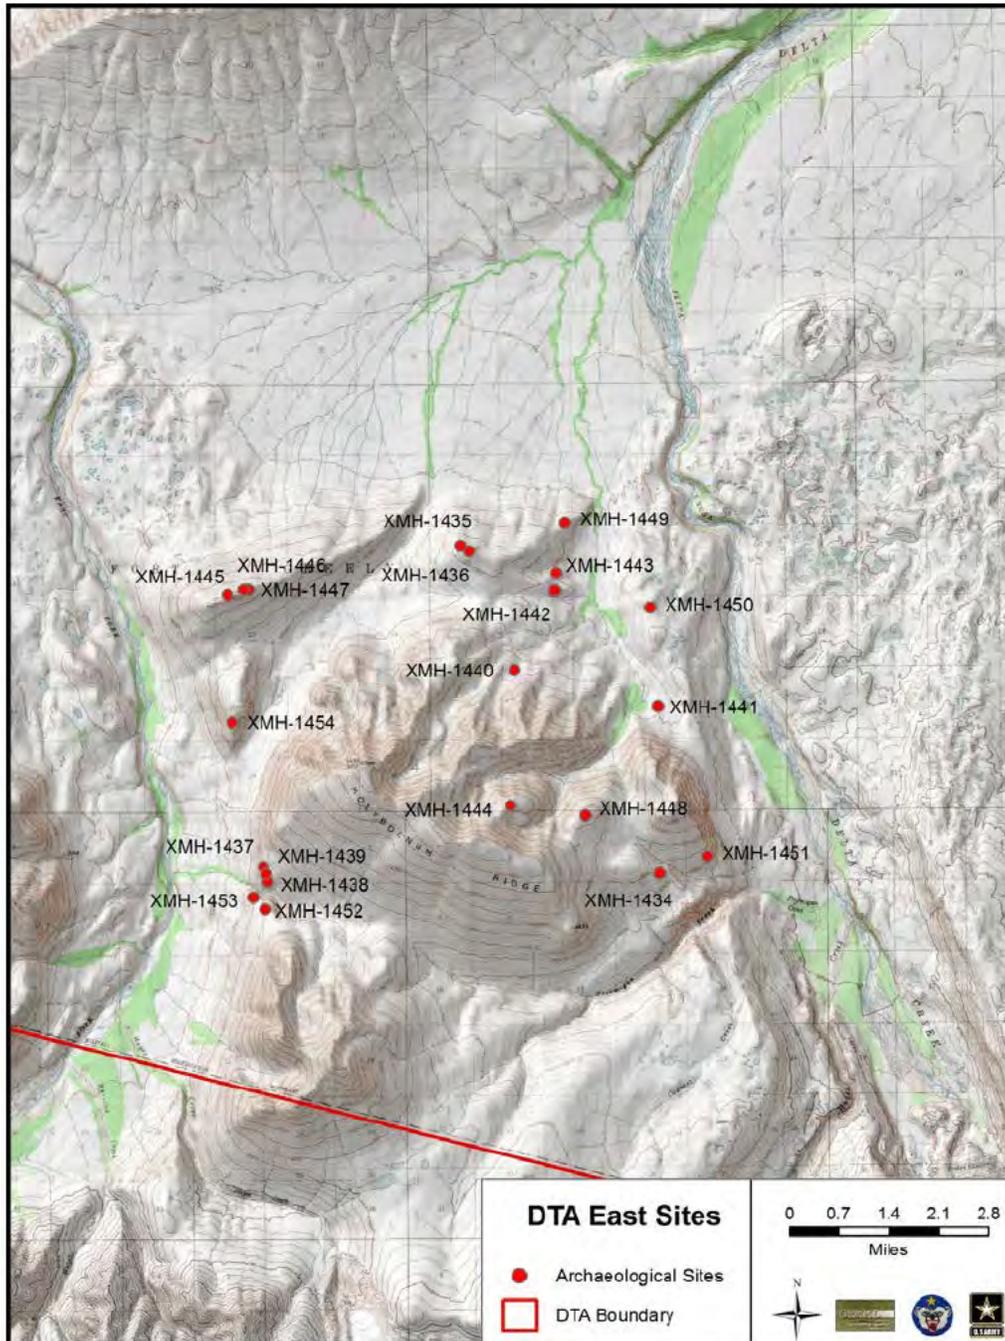

Figure 386. Location of 2011 sites in DTA West, Molybdenum Ridge Area

XMH-01434

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01434 is situated on an east-west trending glacial moraine in the eastern foothills of Molybdenum Ridge, Donnelly Training West, Ft. Wainwright (Figure 387, Figure 388). UTM coordinates are [REDACTED]. Water sources include Delta Creek 4 km to the east, Ptarmigan Creek 1.5 km to the southeast, and a stream 300 m to the northeast flowing from a saddle of Molybdenum Ridge. The viewshed is 360°.

Figure 387. XMH-01434 sketch map

Vegetation consists of moss, lichen, fireweed, grasses, dwarf birch, and other low scrub. Surface exposure is approximately 70% (Figure 389).

The site consists of a surface scatter of 36 lithic flakes, including a concentration of 21 flakes, with 15 additional flakes surrounding the concentration in a 10 meter radius. The surface lithic concentration is contained in a 120x120 cm area. No artifacts were collected and no subsurface testing has been done.

Figure 388. XMH-01434 overview

XMH-01435

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01435 is situated on a northwest- southeast trending glacial moraine in the northern foothills of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 390). UTM coordinates are [REDACTED]. Site XMH-01436 is approximately 150 m to the southeast. Water sources include Delta Creek 4 km to the east, a stream approximately 1 km to the southwest running west-northeast. The viewshed is 360°.

Vegetation consists of moss, lichen, fireweed, grasses, dwarf birch, and other low scrub. Surface exposure is approximately 70% (Figure 391).

The site consists of a surface scatter of four lithic flakes, and one gray spall. One basalt biface, one rhyolite flake and three chert flakes were found from subsurface testing at depths of 0-29 cm BS (Table 71, Figure 392).

Cultural material was buried in the top 30 cm of sediment at the site. Well-sorted silts over bedrock were overlain by sandy silts (Figure 393).

XMH-01436

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01436 is situated on a northwest- southeast trending glacial moraine in the northern foothills of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 394). UTM coordinates are [REDACTED]. Site XMH-01435 is approximately 150 m to the northwest. Water sources include Delta Creek 4 km to the east and a stream 1 km to the southwest that runs west-northeast. The viewshed is 360°.

Vegetation consists of moss, lichen, fireweed, grasses, dwarf birch, and other low scrub. Surface exposure is approximately 70% (Figure 395).

The site consists of a surface scatter of 21 chert flakes, 19 of which are in a 160x160 cm concentration. No artifacts were collected. No subsurface testing was conducted.

Figure 393. XMH-01436 sketch map

Figure 394. XMH-01436 overview

XMH-01437

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01437 is situated on the western end of a knoll at the southwestern base of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 396). UTM coordinates are [REDACTED]. The site overlooks the East Fork of the Little Delta River, approximately 2 km to the west. Another stream 500 m south flows east to west at the base of the knoll into the river. The viewshed is 180°.

Vegetation consists of scattered spruce, moss, lichen, dwarf birch, and other low scrub. Surface exposure is approximately 20%. Site slope is 20°, and the surrounding area slopes 10-20° (Figure 397).

The site consists of a surface scatter of four gray chert flakes and one dark gray chert flake in a 50 x 50 cm area (Table 72). No subsurface testing was conducted.

XMH-01438

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01438 is situated on the southwestern end of a knoll at the southwestern base of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 398, Figures 399-403). UTM coordinates are [REDACTED]. The site overlooks the East Fork of the Little Delta River, approximately 2 km to the west. Another stream, 500 m to the south, flows east to west at the base of the knoll into the river. The viewshed is 270°.

Vegetation consists of scattered spruce, moss, lichen, dwarf birch, and other scrub. A large eroded area of the site provides 100% surface exposure where a majority of the artifacts were found, while the surrounding areas were 85% exposed (Figure 404).

This is a large lithic reduction site consisting of over 350 surface and subsurface artifacts (Figure 405). Artifacts found on the surface include flakes, core fragments, biface fragments, unifaces, shatter, utilized flakes, and projectile points, including one small triangular point and a lanceolate point (Table 73, Figure 406). Material types found include chert and rhyolite. Four shovel tests were excavated and only one contained cultural material.

Figure 397. Aerial view of XMH-01438

One subsurface flake was recovered between 0-10 cm BS (MBT25). Shallow, organic rich silts overlie gravel (Figure 407, Figure 408). Artifacts were found within and directly beneath the root mat.

XMH-01439

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01439 is situated on the western end of a knoll at the southwestern base of Molybdenum Ridge (between XMH-01437 and XMH-01438), Donnelly Training Area West (Figure 387, Figure 409). UTM coordinates are [REDACTED]. The site overlooks the East Fork of the Little Delta River, approximately 2 km to the west. Another stream, 500 m south, flows east to west at the base of the knoll into the river. The viewshed is 180°.

Vegetation consists of scattered spruce, dwarf birch, and other scrub. The area is exposed due to runoff water, and the surrounding area is wet with muskeg and tussocks. Surface exposure is 0-5% and the site slope is 20°.

The site consists of one rhyolite core fragment and one tested cobble. These surface artifacts were not collected and no test pits were excavated.

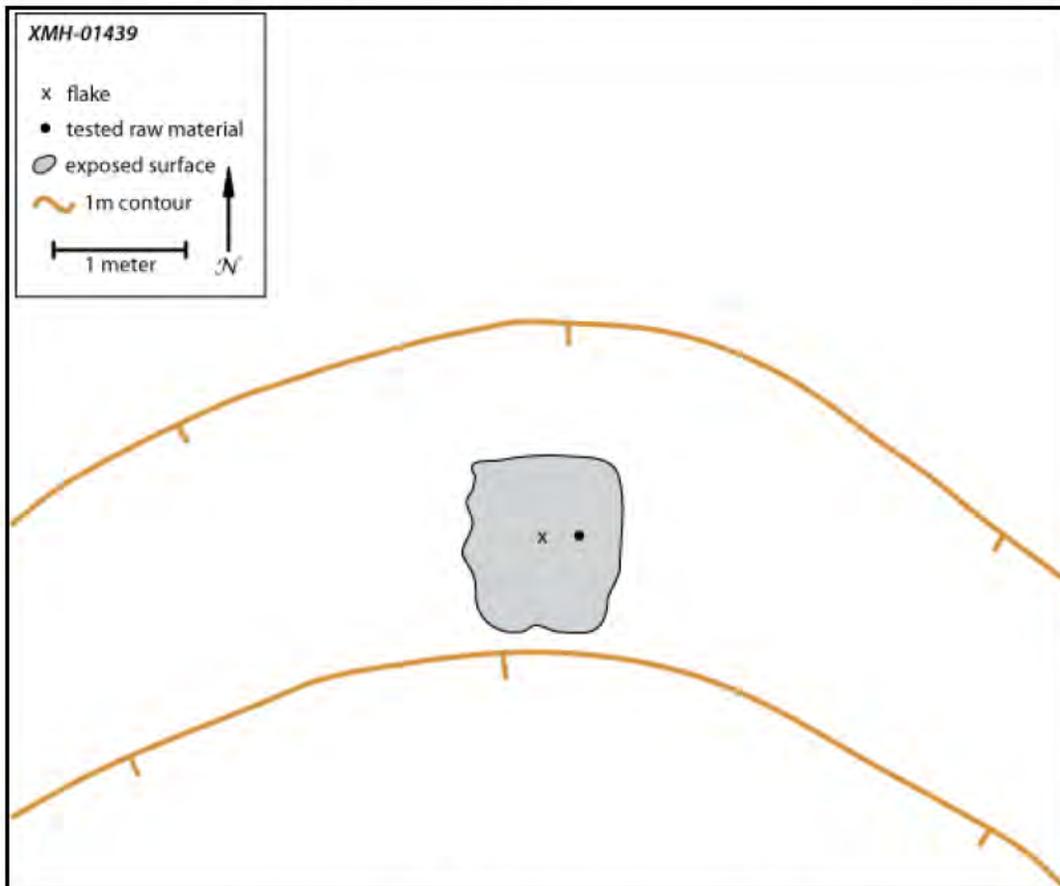

Figure 408. XMH-01439 sketch map

XMH-01440

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01440 is situated on a small rise on a northwest-southeast trending ridge in the northern foothills of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 410). UTM coordinates are [REDACTED]. Nearby water sources include a stream approximately 500 m to the north, which flows northeast into Gold Pan Creek. The viewshed is 270°.

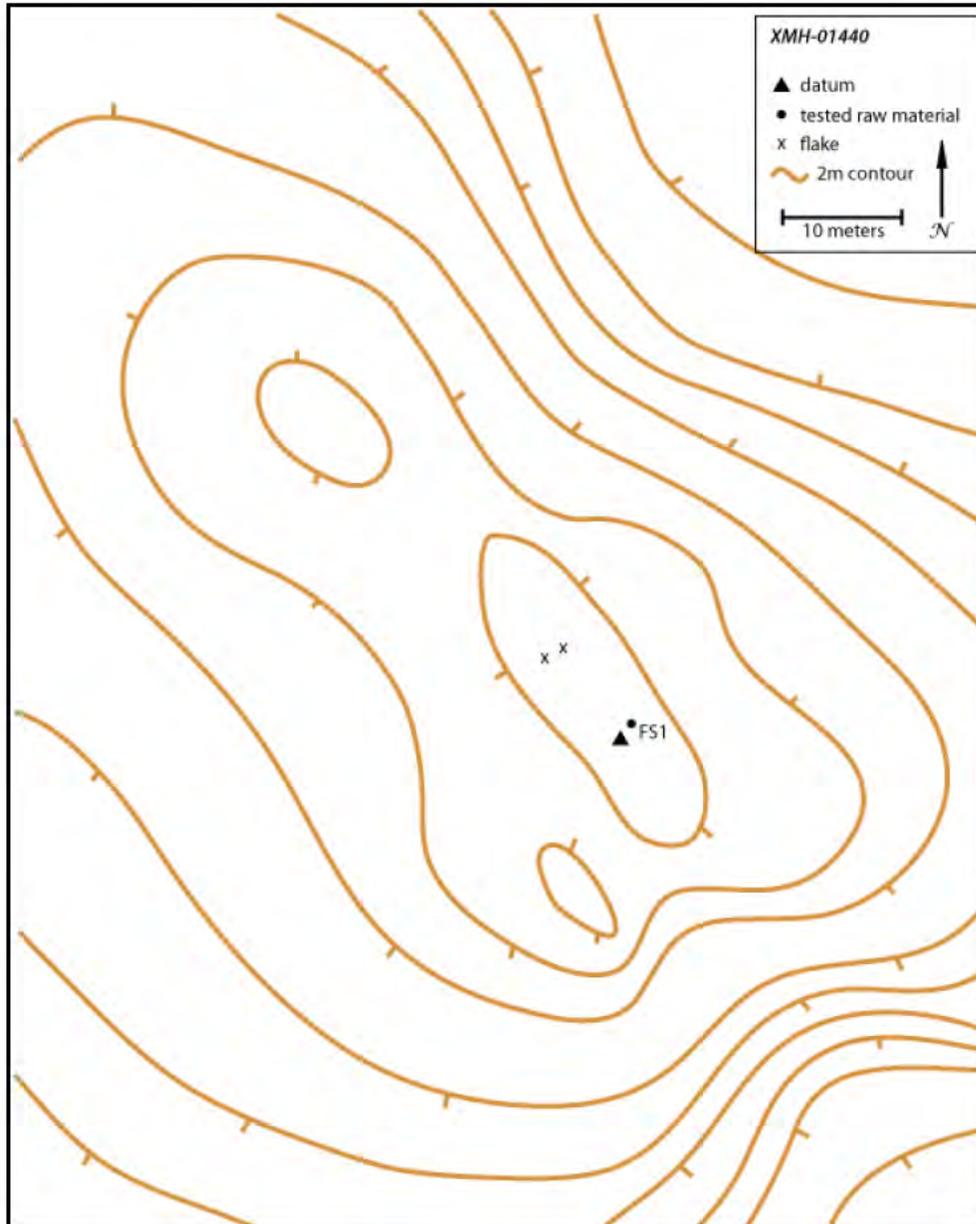

Figure 409. XMH-01440 sketch map

Vegetation consists of low scrub, moss, and lichen. Surface exposure is approximately 10-15%. The site slopes 0-4° (Figure 411).

The site consists of three surface artifacts: two dark gray chert core fragments and one dark gray chert biface preform. Artifacts were located within a 5 m radius. Only the biface was collected (Table 74).

XMH-01441

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

Site XMH-01441 is situated on a north-south trending glacial moraine in the northern foothills of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 412). UTM coordinates are [REDACTED]. Water sources include two small lakes

approximately 200 m to the north-northwest, and a stream, approximately 200 m to the west, flowing from a saddle of Molybdenum Ridge. The viewshed is 360°. Vegetation consists of spruce and scrub birch, mosses, and bearberries. Surface exposure is approximately 10% (Figure 413).

The site consists of a surface scatter of 10 lithic flakes, including a concentration of 8 chert flakes with 2 additional chert flakes approximately 75 meters to the south on the same landform. The surface lithic concentration is contained in a 70 x 70 cm area. No artifacts were collected and no test pits were excavated.

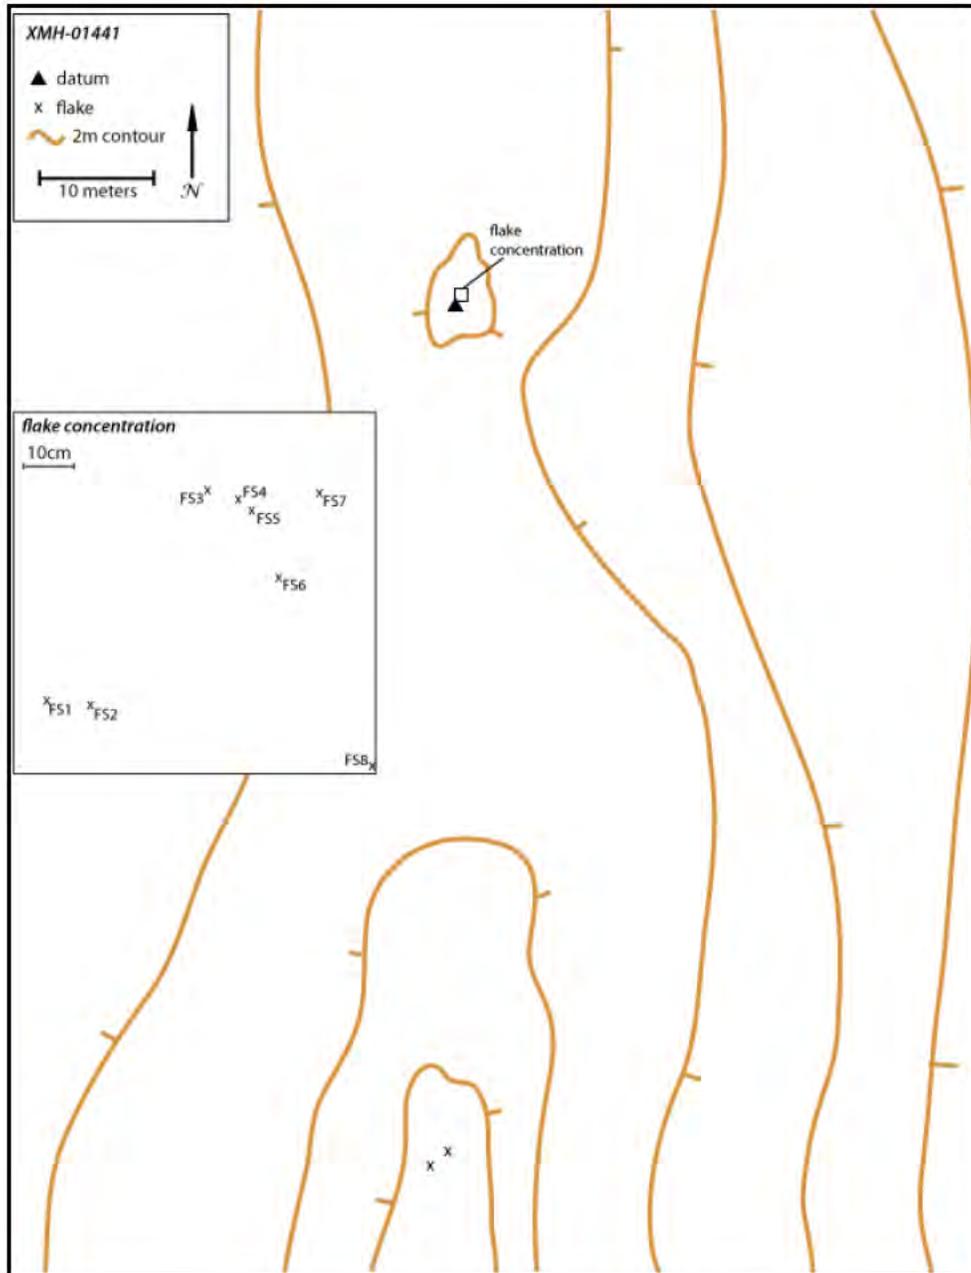

Figure 411. XMH-01441 sketch map

Figure 412. XMH-01441 site overview

XMH-01442

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01442 is located on a linear east-west trending glacial moraine approximately 5 km north of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 414). UTM coordinates are [REDACTED]. Four ridges parallel the site from the foothills of Molybdenum Ridge. Water sources include Gold Pan Creek, 200 m south of the site. The site has an excellent view of Delta Creek approximately 4 km to the east. Site slope is 0-3°, and it descends from a larger ridge and to the valley below at 25°. The site is approximately 20 m above the valley. The viewshed is 360°.

Vegetation consists of bearberry, dwarf birch, low bush cranberry, dwarf alder, and a single spruce tree. Surface exposure is 10-15%, primarily on the crest of the ridge (Figure 415).

The site consists of one flake fragment of light gray chert found on the surface. One shovel test was excavated and found negative for cultural material.

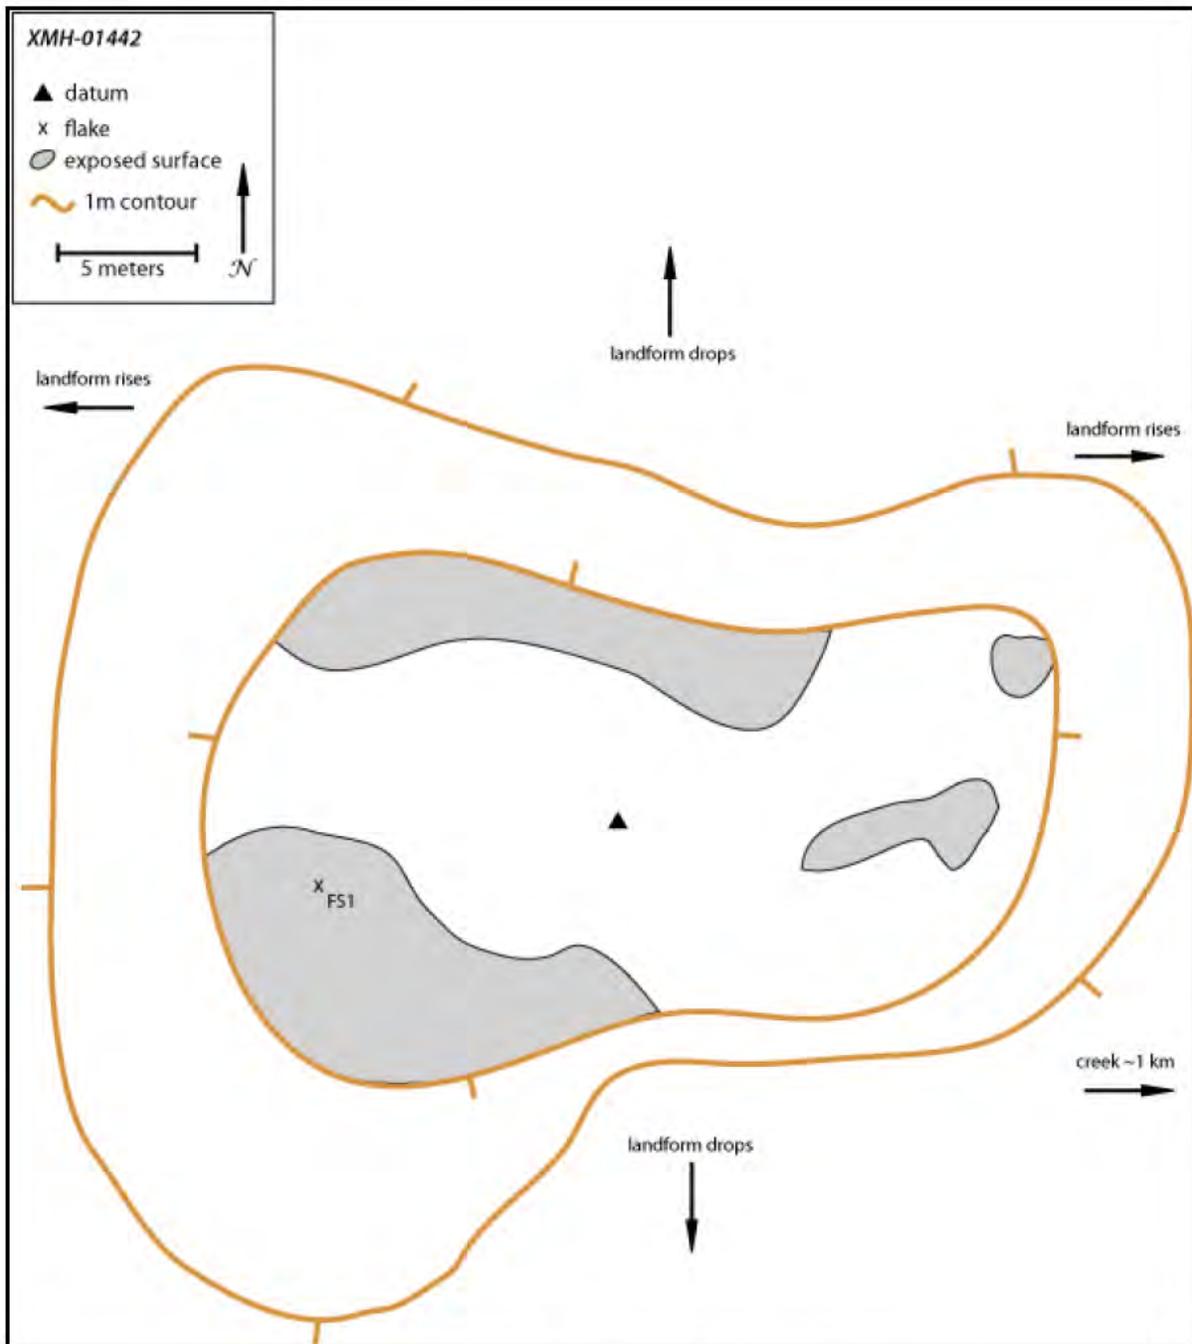

Figure 413. XMH-01442 sketch map

Figure 414. XMH-01442 site overview

XMH-01443

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01443 is situated on a linear east-west trending glacial moraine approximately 5 km north of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 416). UTM coordinates are [REDACTED]. The ridge is about 500 m long east-west. Water sources include Gold Pan Creek, 600 m south and east of the site. The site has an excellent view of Delta Creek approximately 4 km to the east. Site slope is 5°, and it descends from a larger ridge and to the valley below at 25°. The site is approximately 25 m above the valley. The viewshed is 360°.

Vegetation consists of scattered spruce, dwarf aspen, dwarf birch, moss, lichen, crowberry, and bearberry. Surface exposure is 30% in the immediate area (Figure 417)

The site consists of two chert flakes found on the surface (Table 75). No test pits were excavated.

XMH-01444

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01444 is situated atop a knob on a northeast-southwest trending ridge, which extends from Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 418). UTM coordinates are [REDACTED]. Water sources nearby are scarce, but small streams and wetlands exist on the north slope of Molybdenum Ridge approximately 1 km to the northwest and east. The viewshed is 360°, with views of Molybdenum Ridge and the valleys separating the site and foothills. Site slope is 5-15°, and the surrounding area slopes 25-30°. The site is 15-20 m above the surrounding ridge. There are many large, angular granite boulders throughout the site (Figure 419).

The site consists of subsurface lithics found in a shovel test just below the surface in the organic layer (root mat). A chert expanded stem-point base fragment and two chert tertiary flakes (refit) were recovered from 0-10 cm BS (Table 76, Figure 420).

One shovel test (MKT21) was excavated, which was positive for cultural material. Site stratigraphy consists of a dark brown organic layer (0-3cm BS) over a very dark brown silt (3-6 cm BS) and dark brown silt (6-8 cm BS), over dark brown sandy silt (8-30 cm BS). The shovel test was terminated at 30 cm BS (Figure 421, Figure 422).

XMH-01445

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01445 is situated on a northeast-southwest trending glacial moraine northwest of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 423). UTM coordinates are [REDACTED]. Site XMH-01446 (approximately 260 m NE) and XMH-01447 (approximately 340 m NE) are on the same ridgeline. Nearby water sources include Snow Creek, 2 km to the southeast, and the East Fork of the Little Delta River, 2.5 km to the west. There is an expansive valley between the site and Dead Horse Creek 6 km to the north. Site slope is 8-12°, and the surrounding area slopes 12° to the north and 22° to the south. The viewshed is 360°.

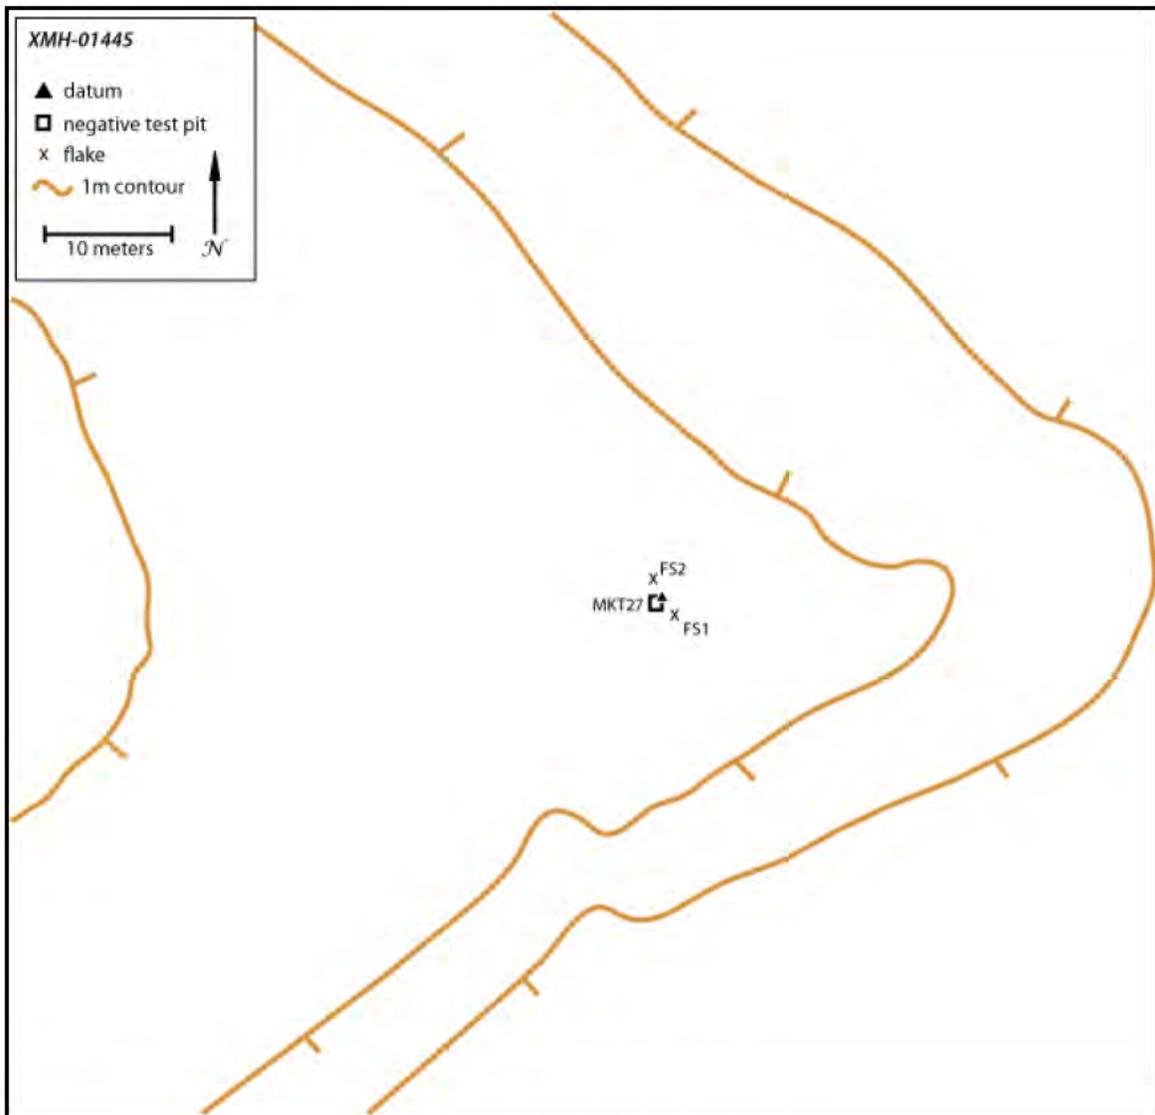

Figure 422. XMH-01445 sketch map

Vegetation consists of grasses, moss, lichen, dwarf birch, and bearberry. Surface exposure is 15-20% (Figure 424).

The site consists of two very dark gray chert flakes recovered from the surface. They were not collected. A test pit (MKT27) placed between the flakes yielded no cultural material.

Stratigraphy consists of an organic layer (0-5 cm BS), dark yellowish brown silt (5-15 cm BS), and dark olive brown silty gravels (15-30 cm BS). The shovel test was terminated at 30 cm BS (Figure 425, Figure 426).

XMH-01446

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01446 is situated on a northeast-southwest trending glacial moraine northwest of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 427). UTM coordinates are [REDACTED]. Site XMH-01445 (approximately 260 m SW) and XMH-01447 (approximately 70 m E) are on the same ridgeline. Nearby water sources include Snow Creek, 2 km to the southeast, and the East Fork of the Little Delta River, 2.5 km to the west. There is an expansive valley between the site and Dead Horse Creek 6 km to the north. Site slope is 8-12°, and the surrounding area slopes 12° to the north and 22° to the south. The view shed is 360°.

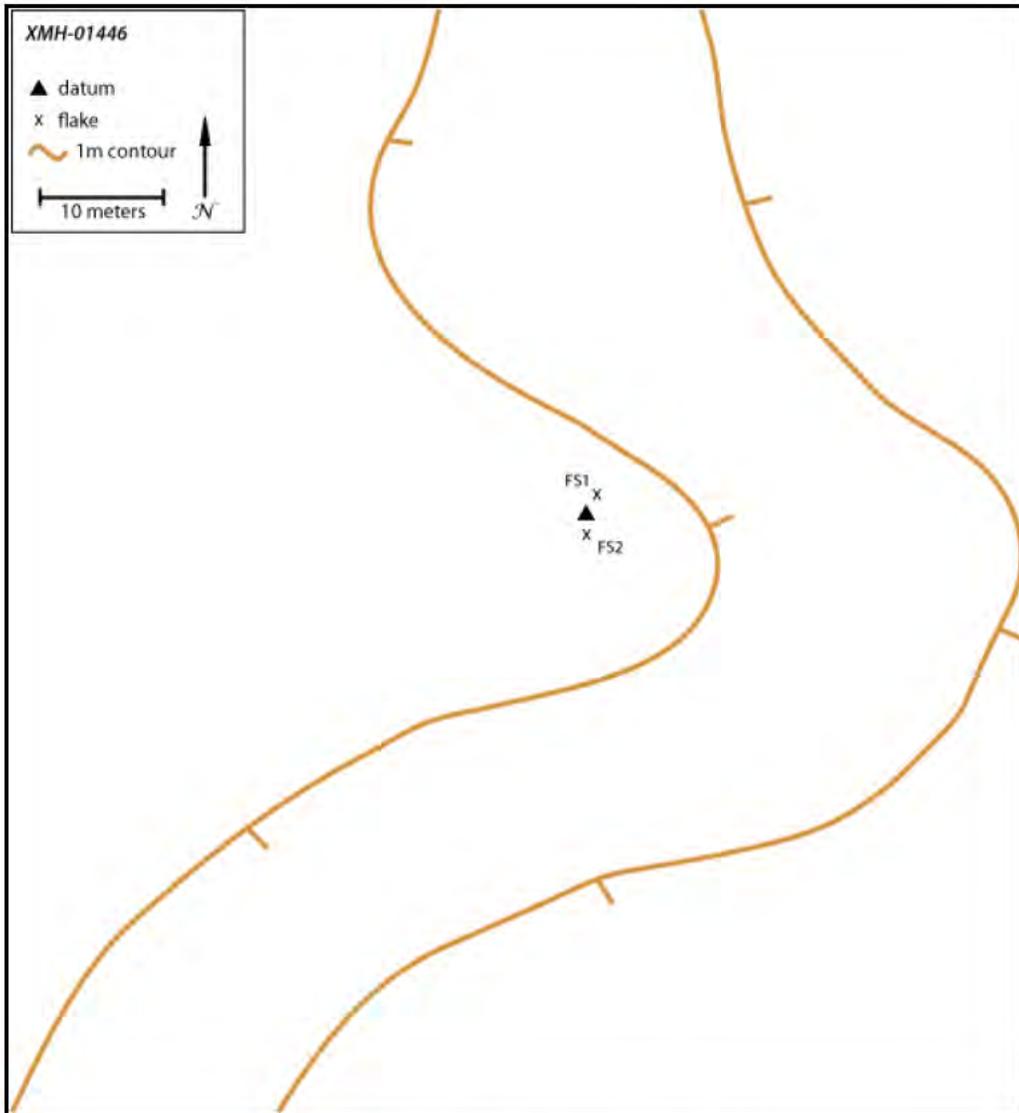

Figure 426. XMH-01446 sketch map

Vegetation consists of grasses, moss, lichen, dwarf birch, and bearberry. Surface exposure is 15-20% (Figure 428).

The site consists of two tertiary chert flakes recovered from the surface, which were collected (Table 77). No subsurface testing was conducted.

Figure 427. XMH-01446 overview

XMH-01447

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

Site XMH-01447 is situated on a northeast-southwest trending glacial moraine northwest of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 429). UTM coordinates are [REDACTED]. Site XMH-01445 (approximately 340 SW) and XMH-01446 (approximately 70 m W) are on the same ridgeline. Nearby water sources include Snow Creek, 2 km to the southeast, and the East Fork of the Little Delta River, 2.5 km to the west. There is an expansive valley between the site and Dead Horse Creek 6 km to the north.

Site slope is 8-12°, and the surrounding area slopes 12° to the north and 22° to the south. The viewshed is 360°.

Vegetation consists of scattered small spruce trees, grasses, moss, lichen, dwarf birch, and bearberry. Surface exposure is 10-15% (Figure 430).

The site consists of one coarse gray banded chert flakes recovered from the surface (Table 78). A test pit (MKT28) placed near the flake yielded no cultural material. Stratigraphy consists of an organic layer (0-5 cm BS) over dark yellowish brown silt (5-15 cm BS) over dark olive brown silty gravels (15-30 cm BS). The test pit was terminated at 30 cm BS (Figure 431, Figure 432).

XMH-01448

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01448 is situated on the crest of a hill east of Molybdenum Ridge, Donnelly Training Area West (Figure 387, Figure 433). UTM coordinates are [REDACTED]. The site is located on a small rock formation that rises above the surrounding area approximately 30 m, spanning a 20 x 40 m area. The landform has a 360° viewshed, which includes Molybdenum Ridge to the west and large valleys to the north and west that contain streams that flow into Gold Pan Creek, Delta Creek to the northeast, and Ptarmigan Creek to the southeast. No water is in the immediate area, although small drainages are nearby. There is 0% surface visibility due to the vegetation and massive rocks that cover the site.

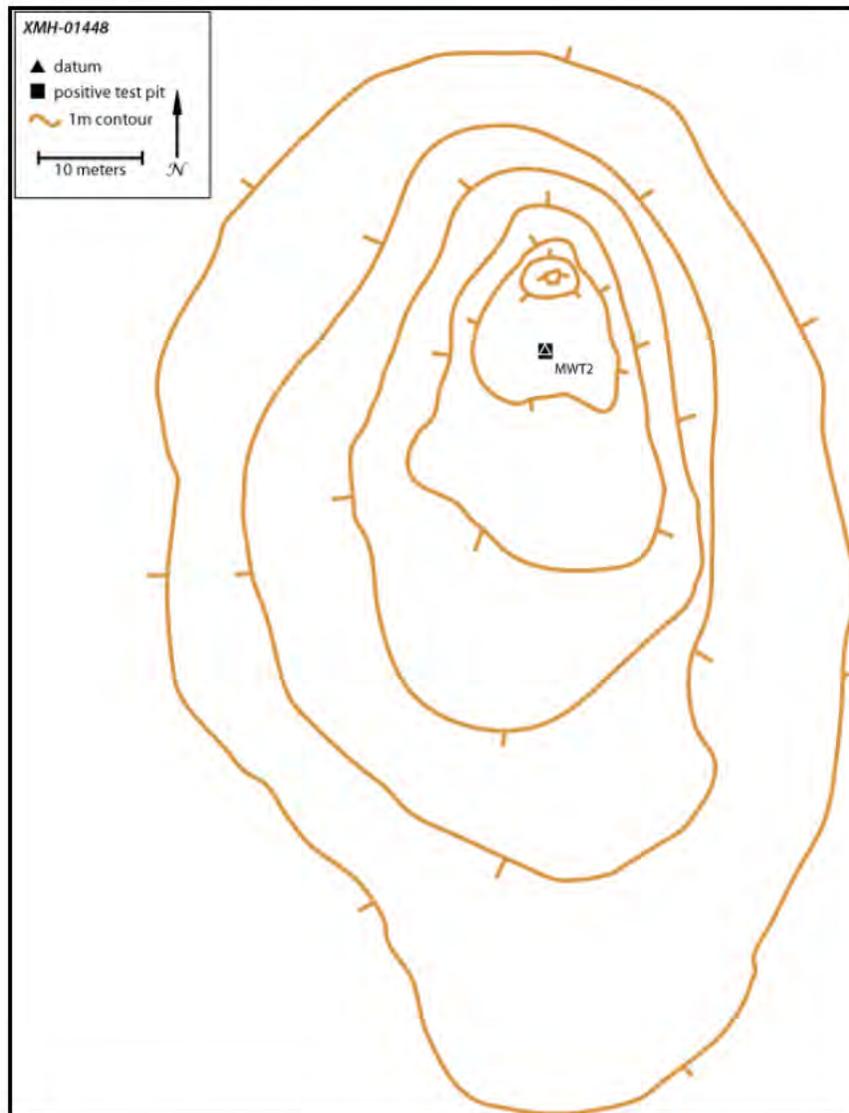

Figure 432. XMH-01448 sketch map

Vegetation consists of moss, lichen, grasses and other low scrub (Figure 434).

Three subsurface flakes found in a single shovel test pit (MWT2), which was excavated in the center of the small rise. Two light brown chert flakes and one third dark gray chert flake were recovered and collected from 0-20 cm BS (Table 79). The test pit was terminated at 28 cm BS (Figure 435, Figure 436).

Figure 433. XMH-01448 overview

Figure 435. XMH-01448 test pit

XMH-01449

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01449 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, Figure 437). UTM coordinates are [REDACTED]. The site is on a prominent knoll 20 x 200 m that extends to the northeast, overlooking large valleys to the east and west as well as the Delta Creek to the east, Dinosaur Ridge to the west, Gold Pan Creek to the east, and Molybdenum Ridge to the south. Vegetation and the continued rise to the southwest obstruct the view from being 360°, but much of the surrounding area is visible from the site. Surface visibility is less than 10% due to vegetation.

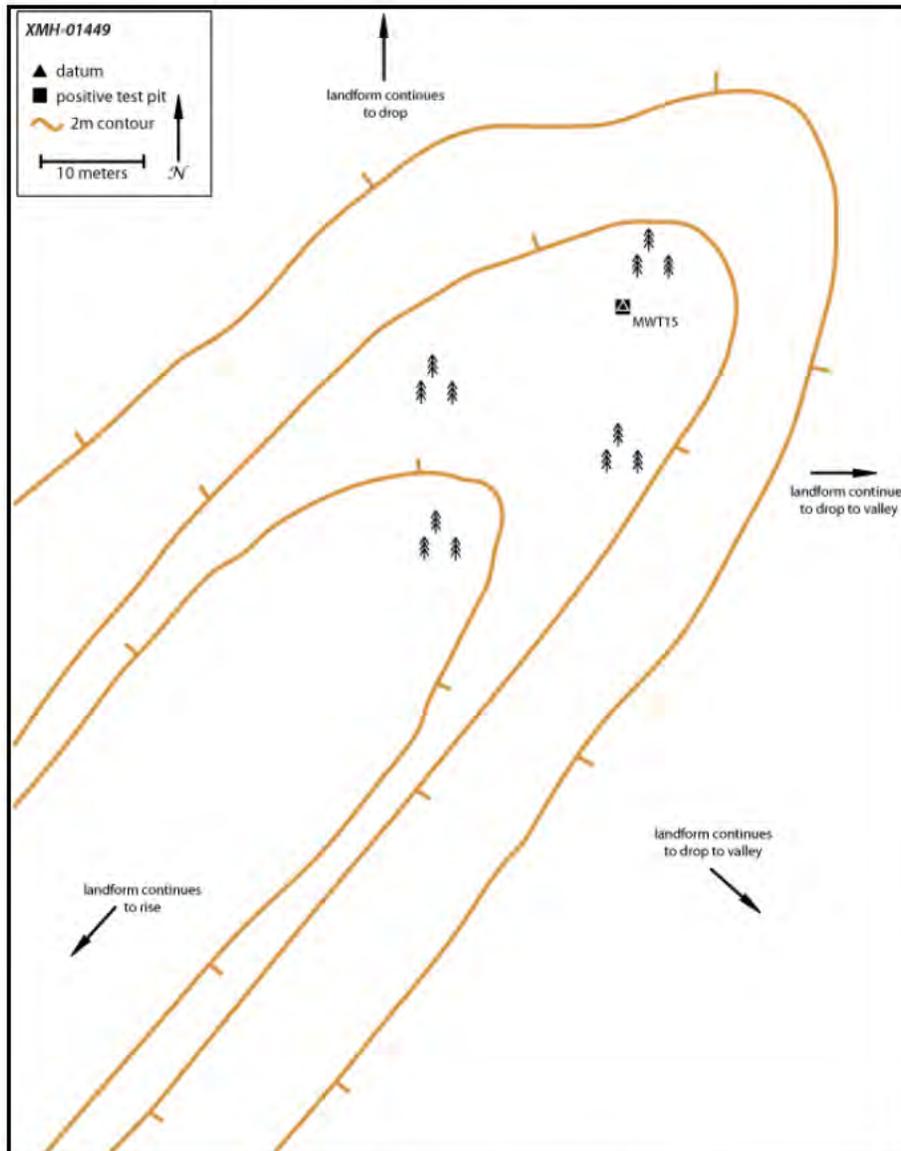

Figure 436. XMH-01449 sketch map

Vegetation consists of grasses, moss, lichen, low scrub, dwarf birch, spruce and birch (Figure 438).

One shovel test (MWT15) yielded two small black chert flakes found 0-10 cm BS (Table 80). The test pit was terminated at 30 cm BS (Figure 439, Figure 440).

XMH-01450

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01450 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, Figure 441, Figure 442). UTM coordinates are [REDACTED]. The site is on a small, rock-covered and vegetated rise on a landform that extends northwest-southeast west of Delta Creek and east of Gold Pan Creek. The rise is approximately 30 x 50 m and less than 10 m above its surrounding area. The adjacent landscape is covered in tussocks and rises >50 m above the surrounding valleys. Molybdenum Ridge is visible to the southwest, Dinosaur Ridge is to the northwest, and small lakes are visible to the northeast. There is 20-30% surface visibility, which consists of gravels and large rocks with some silt.

Vegetation includes low scrub, moss, lichen, dwarf birch, alder, low bush cranberry and blueberry, and scattered spruce (Figure 443).

Fourteen flakes made from a variety of cherts and rhyolite were found on the surface with sizes ranging from 0.5 cm to 2 cm. No artifacts were collected and no subsurface testing was conducted.

Figure 440. Aerial view of XMH-01450

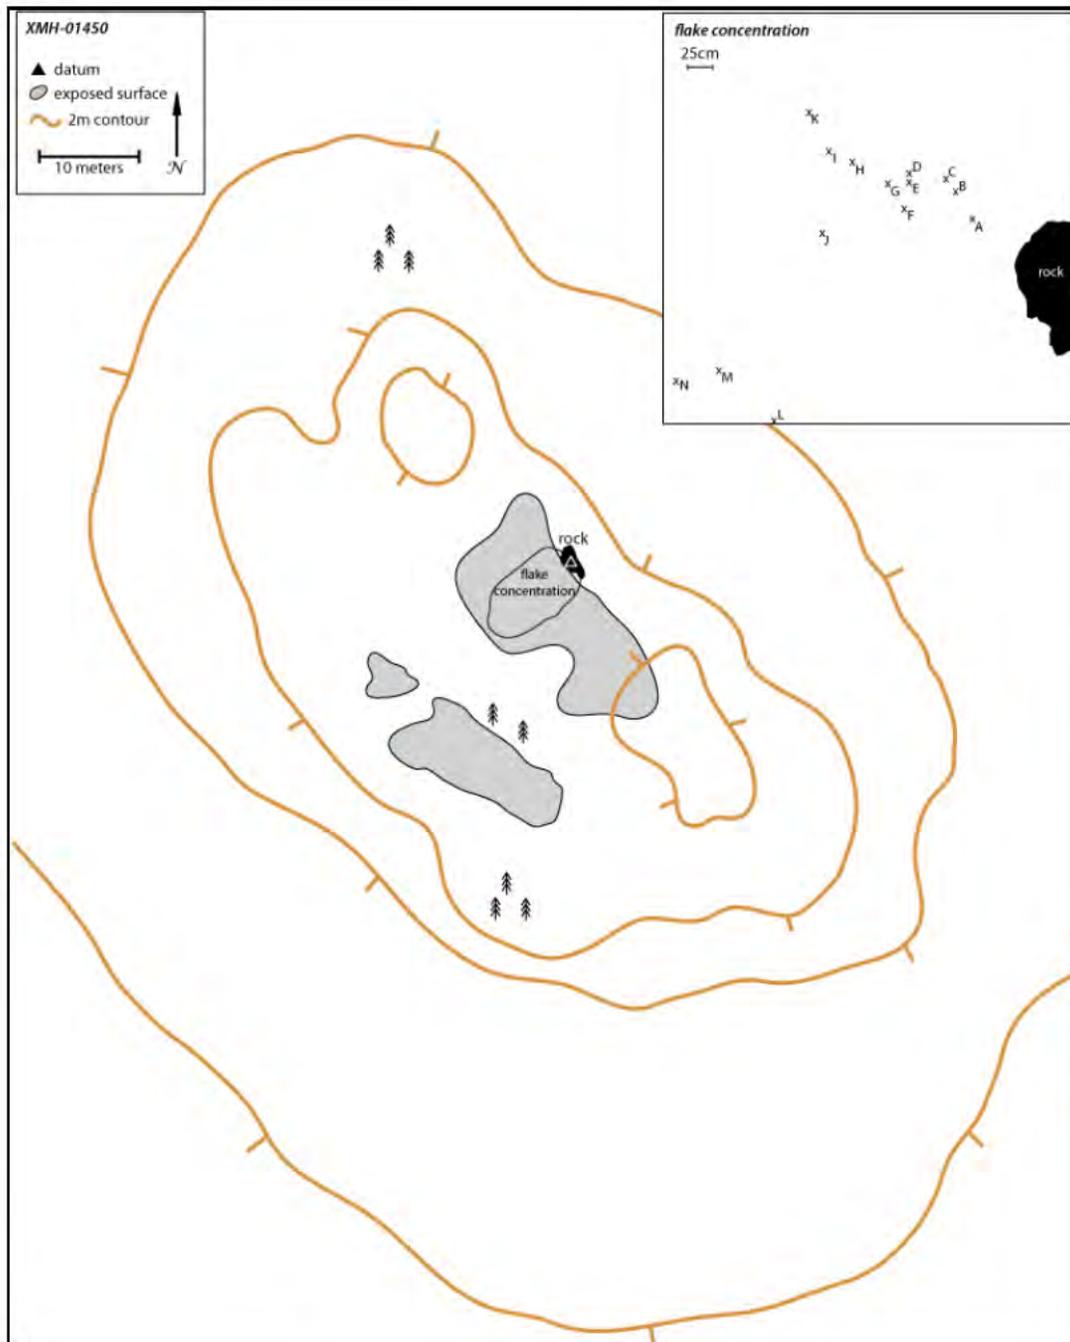

Figure 441. XMH-01450 sketch map

Figure 442. XMH-1450 overview

XMH-01451

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01451 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, Figure 444). UTM coordinates are [REDACTED]. The site is situated on the southeastern base of a mountain 3 km east of Molybdenum Ridge. It overlooks Ptarmigan Creek 1.5 km to the south and Delta Creek 2.5 km to the east. A stream 600 m to the south flows from a saddle of Molybdenum Ridge. Site XMH-01434 is located across this stream 1 km to the southwest. Bennet Airstrip is 3.5 km to the southeast. Site slope is 10-15°, and two large rock formations at the southernmost portion of the landform slope nearly 90°. The viewshed is 270° and includes the Alaska Range to the southeast, Dinosaur Ridge to the northeast, and Molybdenum Ridge to the west. The site has 20-30% surface visibility consisting of large rocks, gravels, and silt. Surface exposure and site erosion are due to wind, water, and high relief of this location relative to adjacent low lying areas.

Vegetation consists of grasses, moss, lichen, low bush cranberry, blueberry, bearberry, other low scrub, dwarf birch, and alder (Figure 445).

One 3 x 2 cm dark reddish brown chert uniface was recovered from the surface of the site (Table 81). No subsurface testing took place at the site.

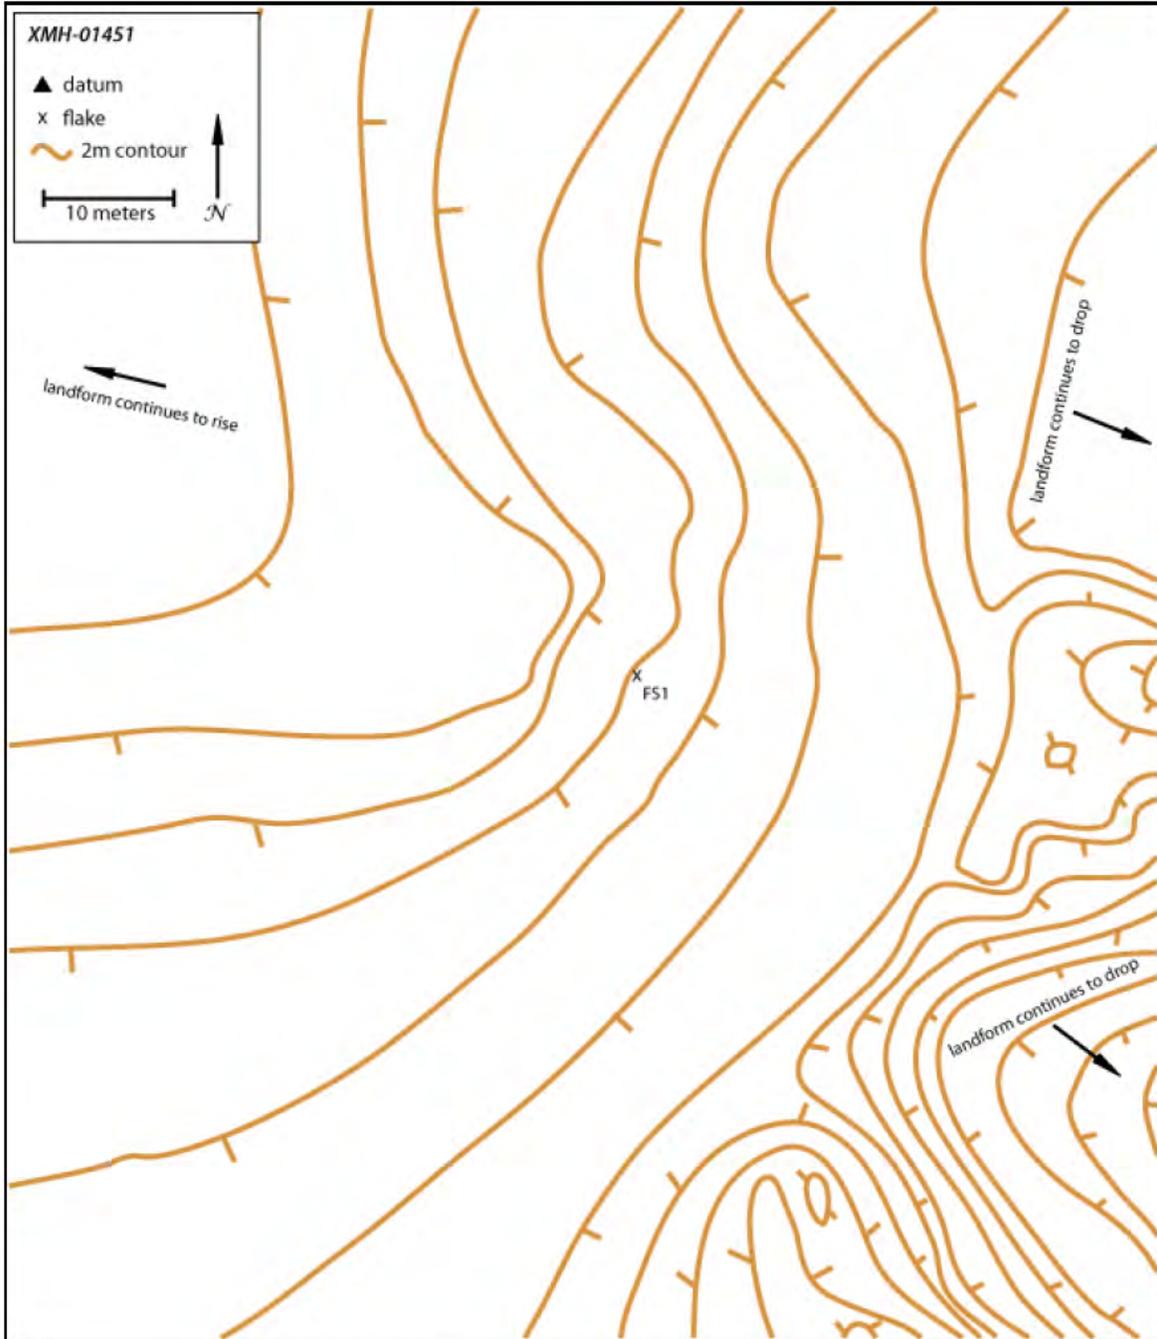

Figure 443. XMH-01451 sketch map

XMH-01452

Latitude: [REDACTED]
Longitude: [REDACTED]
Determination of Eligibility: Not Evaluated

XMH-01452 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, Figure 446). UTM coordinates are [REDACTED]. The site is situated on the northwestern base of Patton Mountain overlooking the East Fork of the Little Delta River, 2.5 km to the west. The site overlooks a creek that separates Patton Mountain and Molybdenum Ridge, which runs east-west approximately 300 m to the north and drains into the East Fork. Sites XMH-01437, XMH-01438, and XMH-01439 are located across this drainage, 700-900 m to the north. XMH-01453 is 350 m to the northwest. XMH-01452 spans approximately 40 x 70 m. The site has a 180° viewshed, which includes the Alaska Range to the southwest. Surface visibility of the site is 15-20% with exposed silts, small gravels and scattered large rocks due to wind and water erosion.

Vegetation consists of grasses, low scrub, moss, lichen, low bush cranberry, blueberry, bearberry, dwarf birch, alder, and spruce (Figure 447).

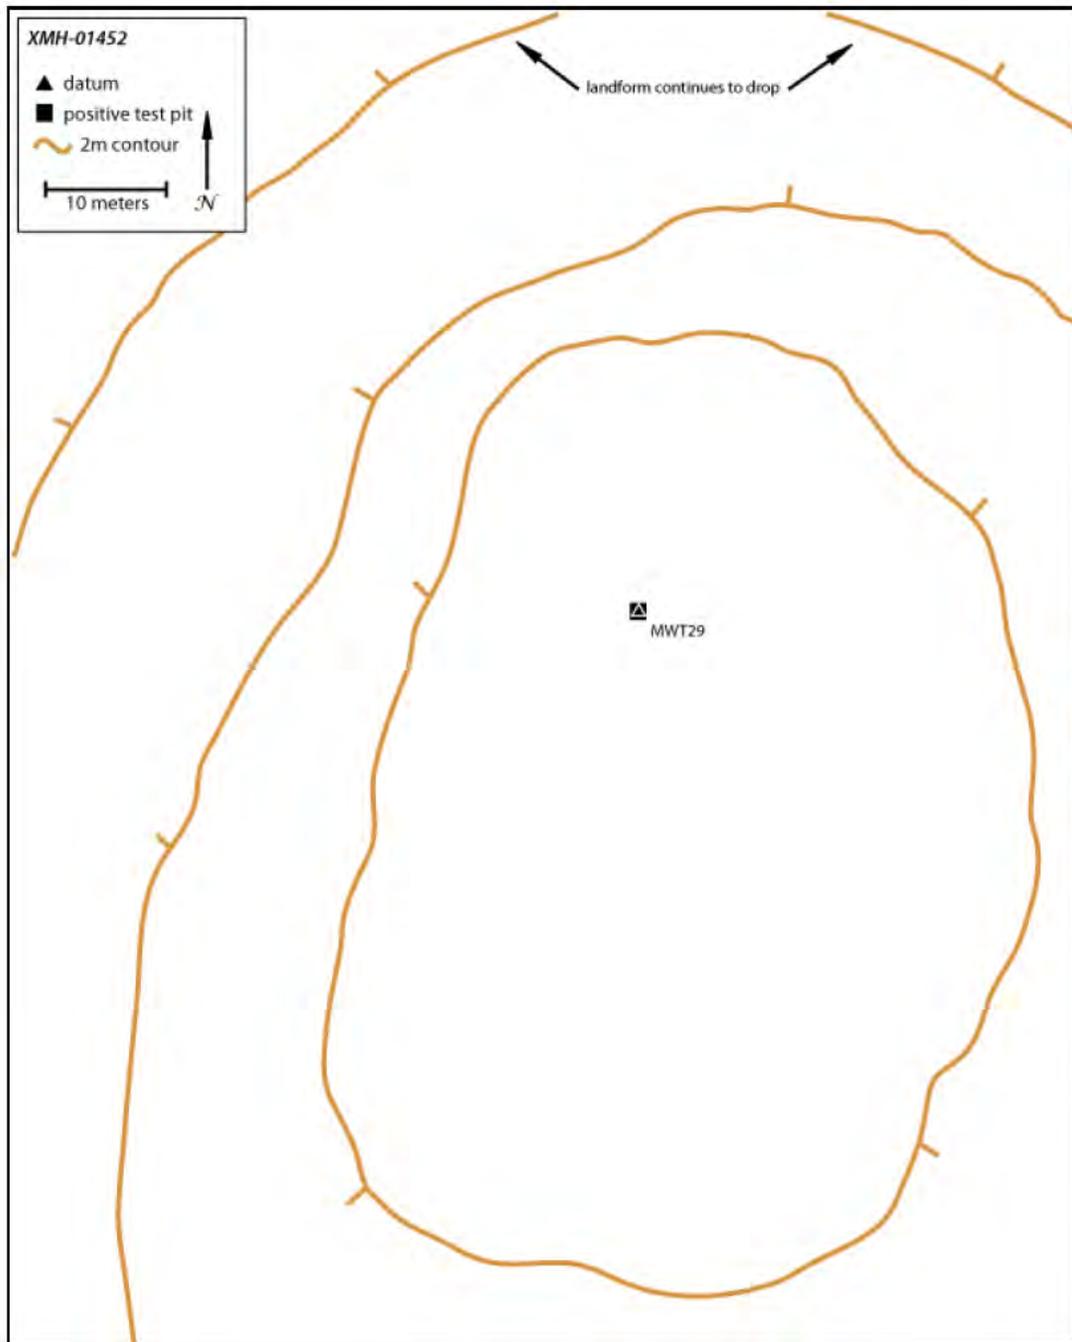

Figure 445. XMH-01452 sketch map

MW-11-5 was found on the basis of subsurface testing. One shovel test pit (MWT29) was excavated and yielded two dark gray chert flakes from 0-10 cm BS (Table 82).

Stratigraphy from the test pit demonstrates a shallow root mat, 0-3 cm BS (10 YR 3/1 very dark gray), overlying a thin layer of silt and mixed gravels, 3-7 cm BS (10 YR 4/2 dark grayish brown), over several other layers of poorly sorted silt with gravels: 7-15 cm BS (2.5 Y 3/3 dark olive brown), 10-15 cm BS (10 YR 3.2 very dark grayish brown), and 15-20 cm BS (2.5 Y 4/2 dark grayish brown) (Figure 448, Figure 449).

Figure 446. XMH-01452 overview

UA2011-431-0001	1	0-10	flake (2)	fragment	dark gray chert

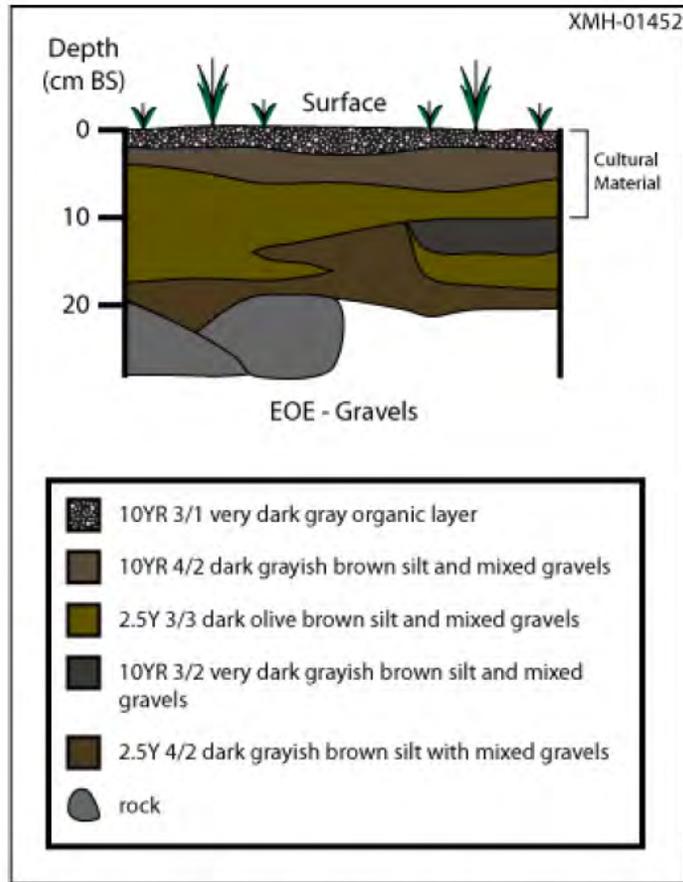

Figure 447. Stratigraphy from XMH-01452

Figure 448. Test pit MWT29

XMH-01453

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01453 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, 450). UTM coordinates are [REDACTED]. The site is situated on the northwestern base of Patton Mountain overlooking the East Fork of the Little Delta River, 2 km to the west. XMH-01453 overlooks a creek that separates Patton Mountain and Molybdenum Ridge, which runs east-west approximately 200 m to the north and drains into the East Fork of the Little Delta River. XMH-01451, XMH-01452, and XMH-01453 are located across this drainage, 500-700 m to the north. XMH-01452 is 350 m to the southeast. XMH-01453 spans an area of approximately 20 x 40 m. The site has a 180° viewshed, which includes the Alaska Range to the southwest. Surface visibility of the site is 15-20% with exposed silts, small gravels and scattered large rocks due to wind and water erosion.

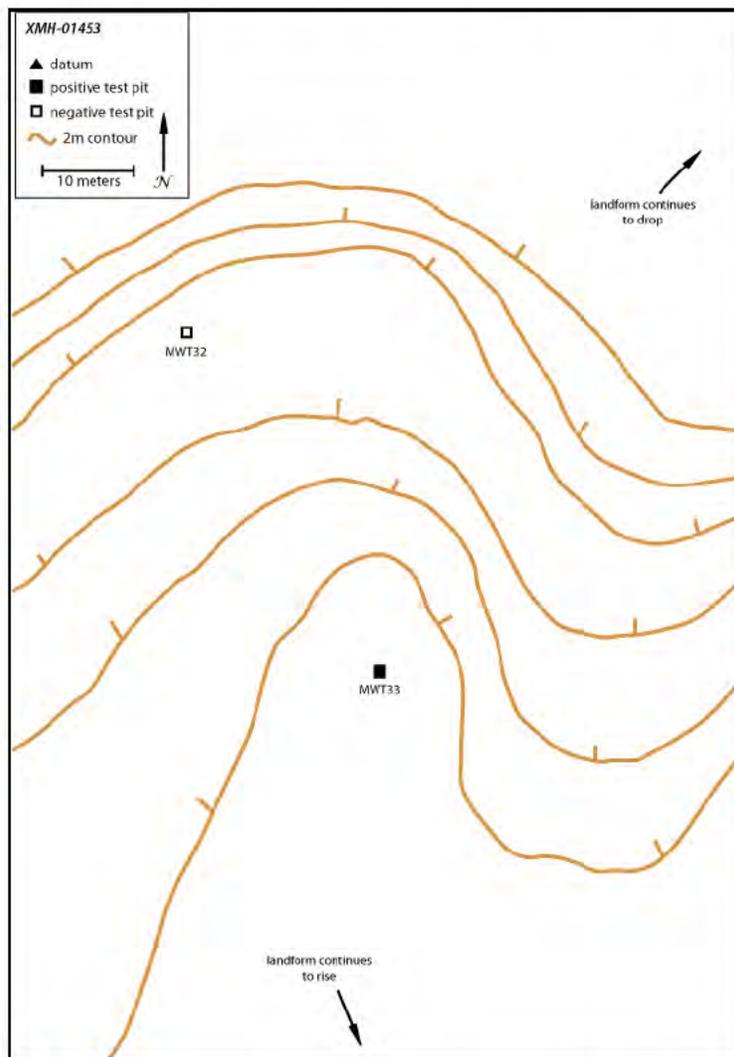

Figure 449. XMH-01453 sketch map

Vegetation consists of grasses, low scrub, moss, lichen, low bush cranberry, blueberry, bearberry, dwarf birch, alder, and spruce (Figure 451).

XMH-01453 was found on the basis of subsurface testing. Two shovel test pits were excavated, one of which (MWT33) yielded cultural material. One light gray chert flake was recovered from 0-10 cm BS (Table 83).

The stratigraphy from the test pit (MWT33) shows that a shallow root mat, 0-3 cm BS (10 YR 3/1, very dark gray), overlies organic-rich silt with gravel inclusions, 3-14 cm BS (10 YR 4/2, dark grayish brown), over a more poorly sorted organic-rich silt with gravel, 14+ cm BS (2.5 Y 3/3, dark olive brown) (Figure 452, Figure 453).

Figure 450. XMH-01453 overview

UA2011-432-0001	1	0-10	flake	fragment	rhyolite

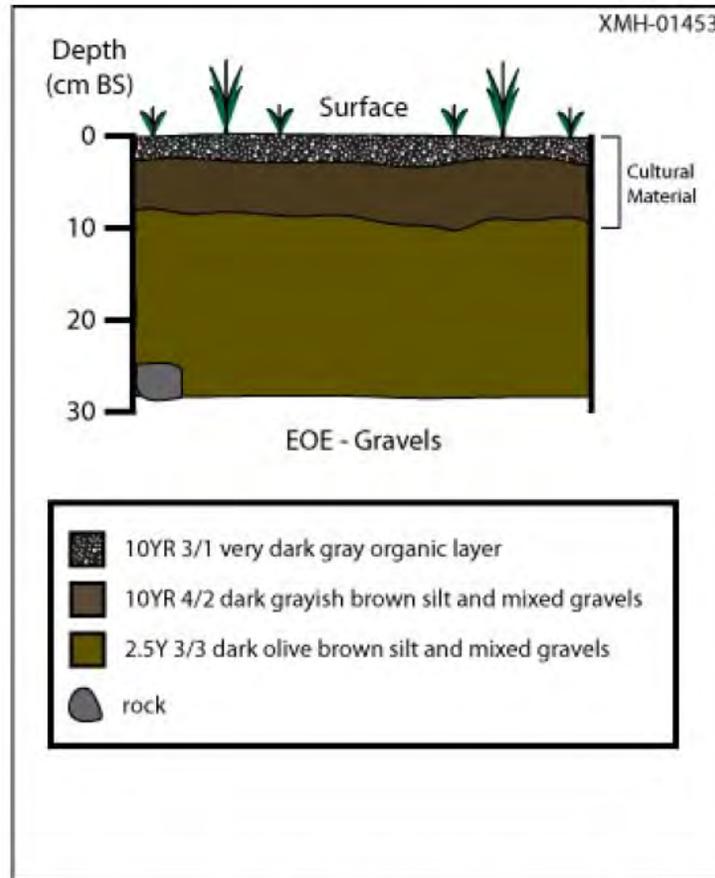

Figure 451. XMH-01453 stratigraphy

Figure 452. Test pit MWT33

XMH-01454

Latitude: [REDACTED]

Longitude: [REDACTED]

Determination of Eligibility: Not Evaluated

XMH-01454 is located in the Molybdenum Ridge area of Donnelly Training Area West (Figure 387, Figure 454). UTM coordinates are [REDACTED]. The site is situated on the southern portion of a landform that trends north-south, with a valley on each side. The Alaska Range is visible to the southwest and south, and Molybdenum Ridge is to the east. Delta Creek is visible to the northeast, and a glacial drainage runs parallel to the landform to the west. The East Fork of the Little Delta River is approximately 1.5 km to the west. The site spans a 20 x 20 m area. Surface visibility is close to 15% due to wind and water erosion.

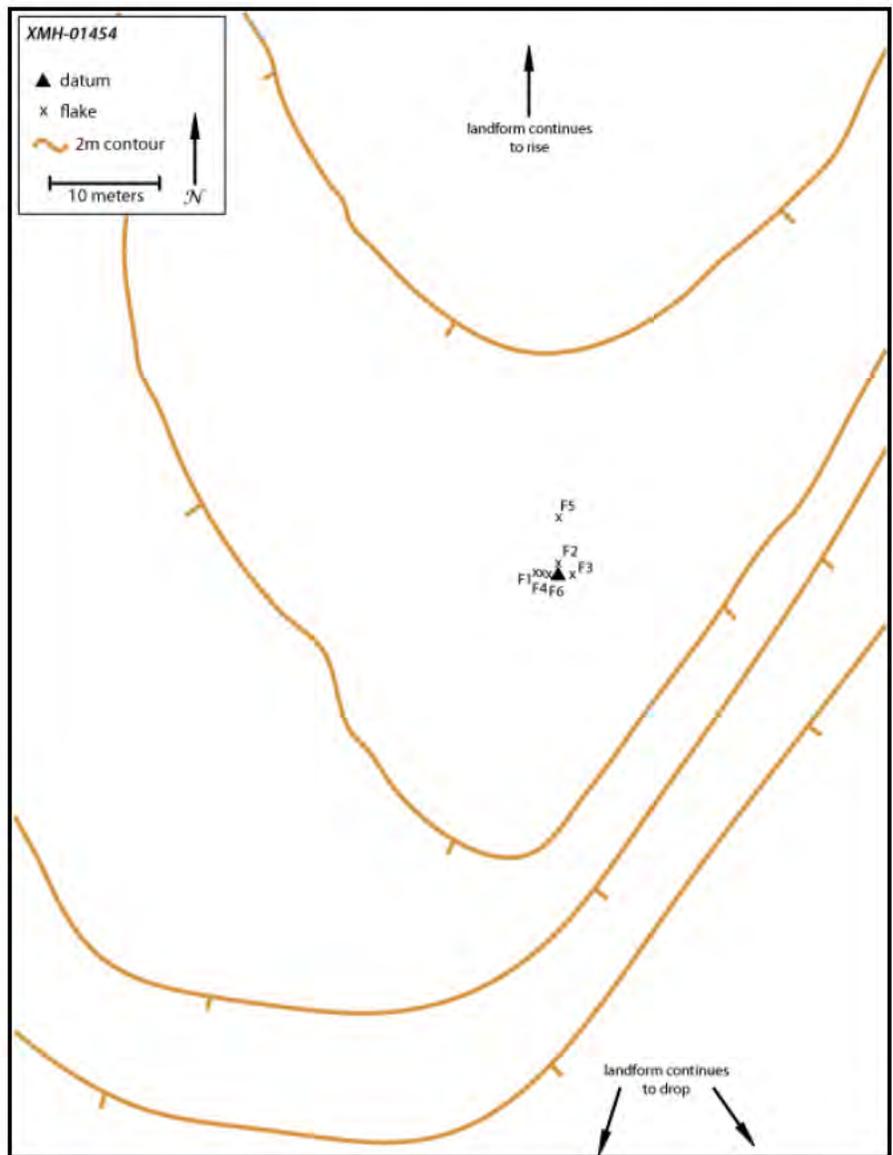

Figure 453. XMH-1454 sketch map

Vegetation consists of moss, lichen, low scrub, low bush cranberry and blueberry, as well as dwarf birch, alder, spruce, and grasses (Figure 455).

The site consists of 4 surface flakes including two tan rhyolite flakes, one dark gray broken basalt flake, and one tan rhyolite flake fragment. No artifacts were collected. No subsurface testing was conducted.

Figure 454. XMH-01454 overview

7.0 GERSTLE RIVER TRAINING AREA (GRTA)

7.1 Introduction

GRTA (Figure 456) consists of a rectangular area over 20,500 acres in size, located 20 miles southeast of DTA. GRTA lies between Granite Mountain and Gerstle River, about 3 miles south of the Alaska Highway. The entire training area is located within the Tanana drainage basin. Topographic features are related to the glacial and alluvial histories of the area and include terminal moraines, outwash fans, braided streams, kettle lakes, and loess deposits.

There are two main vegetation types in GRTA: open low growing spruce forests and closed spruce-hardwood forests. Low lying areas are dominated by shrub wetlands or bogs.

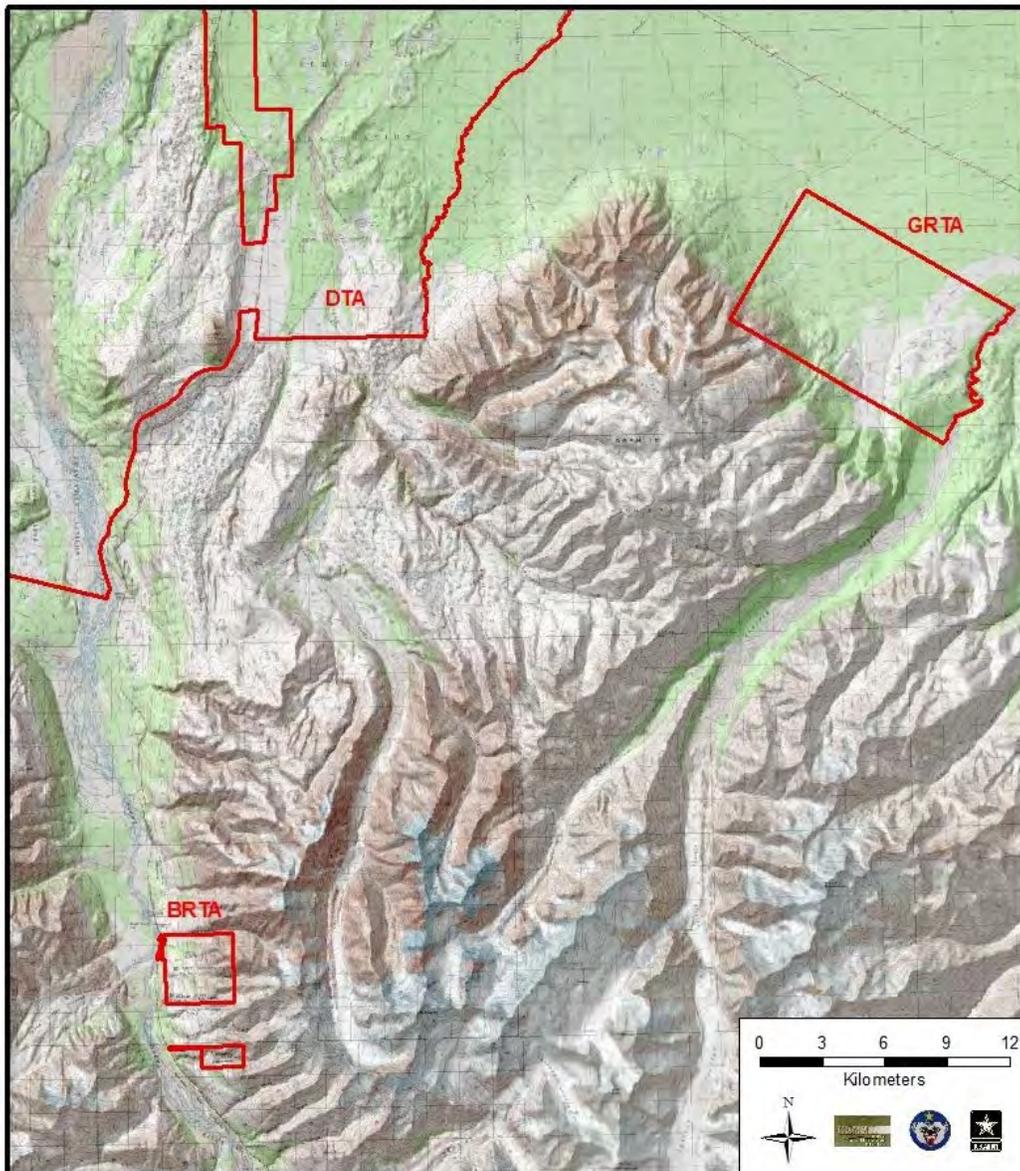

Figure 455. GRTA and BRTA in relation to DTA

7.2 GRTA Surveys

Very little development has been undertaken in GRTA in the last decade and so very little is known about the cultural resources in the area. Two small surveys took place in 2011 for the purpose of opening up areas to public timber sales (Figure 457).

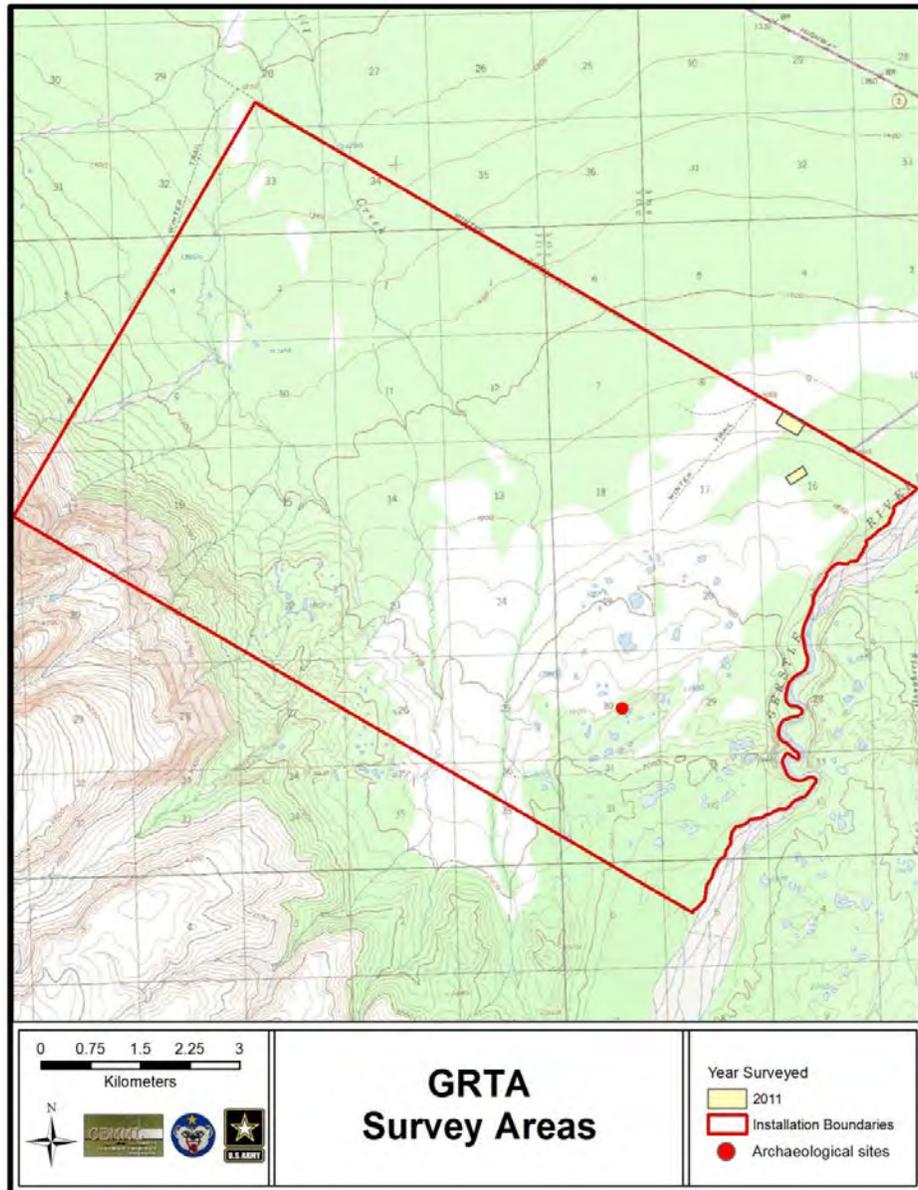

Figure 456. GRTA survey areas by year and location of archaeological sites

7.3 GRTA Sites

Only one archaeological site is known from GRTA. XMH-01359 is a prehistoric site that has not been evaluated for the NRHP (Figure 457).

8.0 BLACK RAPIDS (BRTA) AND WHISTLER CREEK TRAINING AREAS

8.1 Introduction

BRTA and Whistler Creek Training Area encompass 2,300 and 530 acres of land, respectively, southeast of Fort Greely and DTA along the east side of the Richardson Highway (Figure 456). Rugged mountain terrain in the eastern portion of the training areas slopes down to valley floors along the western border of each unit. White spruce forest covers the valley floors. The vegetation in the majority of both areas is above treeline.

8.2 BRTA and Whistler Creek Surveys

Approximately 250 acres of BRTA have been surveyed by CEMML for archaeological sites (Figure 458). Future plans by the Army to put a range in the eastern portion of the training area will require additional survey in 2012. No surveys have taken place in the Whistler Creek area.

8.3 BRTA and Whistler Creek Sites

Two archaeological sites are known from BRTA. XMH-00317 and XMH-00318 are both prehistoric lithic scatters that have not been evaluated for the NRHP (Figure 458).

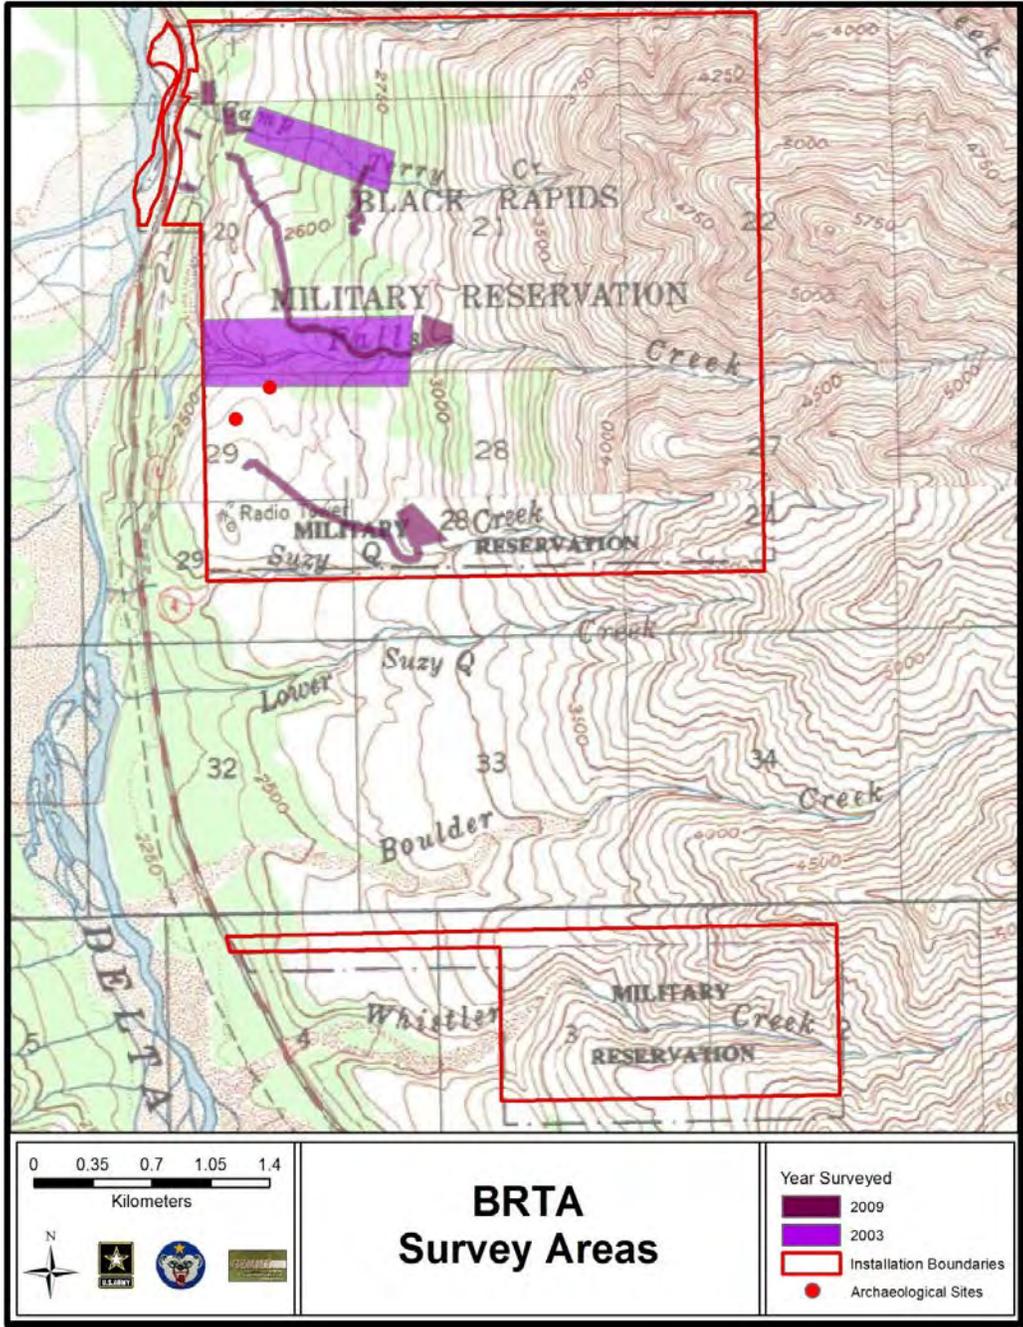

Figure 457. BRTA survey areas by year and location of archaeological sites

9.0 SUMMARY AND RECOMMENDATIONS

9.1 Summary

9.1.1 Cantonment

One new site was located in the cantonment during the 2011 field season. The cantonment has now had a 100% survey of all areas not considered previously disturbed (24% of the cantonment– the developed town of Fort Wainwright).

9.1.2 YTA

Four new archaeological sites were located in YTA during the 2010 and 2011 field seasons. Two of these sites are located under collapsed rockshelters. Nearly 15% of land in the training area has now been systematically surveyed.

9.1.3 TFTA

Fifty-five new archaeological sites (described above) were located during the 2010 field season, bringing the total to 87 prehistoric archaeological sites identified in TFTA during 2009 and 2010. This research more than doubled the number of known sites from TFTA and underscores the importance of cultural resources in this relatively unstudied terrain. Nearly all of these are intact buried sites, with demonstrated integrity, and undisturbed stratigraphy. These sites span the timeframe of human occupation in Alaska from the earliest peoples to the late prehistoric occupation. As such, all of these can yield data for addressing a number of important regional questions and can provide significant information pertaining to the prehistory of Interior Alaska. They are all potentially eligible for inclusion in the NRHP. Despite recent projects, only 0.1% of land in the training area has had systematic survey.

9.1.4 Dyke

No new archaeological sites were discovered in the Dyke Range in 2010 or 2011. Much of the range is in the active floodplain, and only 0.5% of the total area has been surveyed.

9.1.5 DTA

Twenty-seven new archaeological sites were located in DTA in 2011. Of these sites, 21 were located in the Molybdenum Ridge area that had never previously been investigated. CEMML survey efforts have concentrated on DTA East. Nearly 70,000 acres in DTA have now been surveyed, accounting for 11% of the entire area.

9.1.6 GRTA

Only 0.1% of land in GRTA has been surveyed. No new archaeological sites were found in 2010 or 2011.

9.1.7 BRTA and Whistler Creek

No surveys took place in BRTA or Whistler Creek during the 2010 or 2011 seasons. Approximately 11% of BRTA had been previously surveyed, while none of Whistler Creek has been surveyed.

9.2 DOEs

Eight sites from the Tanana Flats, described above, have been determined eligible for the NRHP based on preliminary investigations (Table 84). This document will serve as a request for concurrence from the SHPO for these eight determinations (see Appendix 1 for DOE forms).

Table 84. Sites described as eligible for the NRHP

AHRS Number	Description	Integrity	Criteria Met	Period of Significance	Areas of Significance	Level of Significance
FAI-02043	lithic and faunal scatter	intact buried site	C, D	10,730 C14 years BP, Palaeoarctic	Archaeology: prehistoric	regional, national
FAI-02047	lithic and faunal scatter	intact buried site	D	1,430 C14 years BP, Athabaskan	Archaeology: prehistoric	regional, state
FAI-02060	lithic scatter	intact buried site	D	8,130 C14 years BP, Palaeoarctic	Archaeology: prehistoric	regional, state
FAI-02063	lithic scatter	intact buried site	D	unknown	Archaeology: prehistoric	regional, state
FAI-02064	lithic scatter	intact buried site	D	2,170 C14 years BP, Athabaskan	Archaeology: prehistoric	regional, state
FAI-02066	lithic scatter	intact buried site	D	unknown	Archaeology: prehistoric	regional, state
FAI-02073	lithic scatter	intact buried site	D	possibly Palaeoarctic	Archaeology: prehistoric	regional, national
FAI-02077	lithic scatter	intact buried site	C, D	10,130 C14 years BP, Palaeoarctic	Archaeology: prehistoric	regional, national

9.3 Future Plans

9.3.1 Cantonment

In order to best protect cultural resources in locations with potential to be disturbed by recreation and military activities, DOEs for all archaeological sites in the cantonment are planned for the 2012-2015 field seasons. Once these determinations have been made, efforts can be concentrated on stabilizing eligible sites and promoting public education.

9.3.2 YTA

YTA has not proven to be rich in archaeological resources. Surveys will continue to be closely tied to Army undertakings. DOEs of sites along the road system in YTA are planned for the 2012-2015 field seasons. Once these determinations have been made, efforts can be concentrated on protecting eligible sites.

9.3.3 TFTA

TFTA is a vast area, but the majority of the research potential is limited to the upland areas including buttes, dunes, lake margins, and terrace edges. Recent research and discovery of deeply buried archaeological sites with terminal Pleistocene dates are extremely important. They may all yield data for addressing a number of important regional questions and will provide significant information pertaining to the prehistory of Interior Alaska.

A total of 36 prehistoric archaeological sites were identified in the landforms surrounding Blair Lakes during 2010. All except two of these are intact buried sites, with demonstrated integrity, and undisturbed stratigraphy. Six sites on the terrace edge are confidently assigned as belonging to the terminal Pleistocene. As such, they are among the oldest sites on the continent and likely represent the traces of the first peoples to migrate to North America from northeast Asia. Testing at FAI-02043 identified at least two components, the earliest of which occurs in the upper portion of the sands at 95-110 cm BS. The recovered assemblage consists of lithics and fauna including Alaskan hare (*Lepus othus*), large waterfowl (*Anatidae*; goose/swan/large mallard-sized fowl) and bison (*Bison* sp.) associated with a charcoal age of $11,600 \pm 50$ ¹⁴C years BP. The later component consists of lithic debitage in the lowest portions of the loess at 80-90 cm BS and produced a charcoal date of $10,730 \pm 50$ ¹⁴C years BP. FAI-02077 produced debitage, microblades, and a biface from the lower loess near the sand contact at 35 cm BS with a charcoal date of $10,130 \pm 50$ ¹⁴C years BP. Other sites on the landform—FAI-02050, FAI-02051, and FAI-02066—remain undated; however, artifacts deeply buried in the lower sands indicate terminal Pleistocene ages.

Future work in this area is tied to proposed joint Army-Air Force projects that include potentially putting a road through the Tanana Flats to the Blair Lakes Impact Area. This would require archaeological survey of the proposed roadway, DOEs of newly discovered sites in the Blair Lakes region and evaluation of their potential for inclusion in the Blair Lakes Archaeological District, and systematic pedestrian surveys along the proposed road route through the Blair Lakes area. The Army and CEMML are working closely together to plan budgets and funding to support these cultural research projects in event that the Tanana Flats roadway project is funded.

9.3.4 Dyke

No surveys are planned for the Dyke Range in the immediate future as no other Army projects are planned for the area.

9.3.5 DTA

Archaeological sites are found in high density in DTA. Military undertakings are planned in close association with CEMML to ensure that cultural resources are not adversely affected. DOEs of sites along the OP Road and in other high traffic areas are planned for the 2012-2015 field seasons so that eligible sites can be protected from unintentional adverse effects of recreation and maintenance. Pedestrian surveys of the remaining unsurveyed portions of DTA East are also planned for the upcoming field seasons. Molybdenum Ridge continues to be an area of interest for range development. Systematic pedestrian survey of the range footprint and winter road footprint to Molybdenum Ridge will take place in 2012. Any sites found within the footprint will be evaluated for NRHP eligibility. Further mitigation will depend on site eligibility and the possibility of avoiding sites by adjusting the boundaries of the planned undertakings.

9.3.6 GRTA

No future surveys or investigations are planned for GRTA. Any survey there will be closely tied to military undertakings.

9.3.7 BRTA and Whistler Creek

Surveys in BRTA are planned for the 2012 field season because of the possibility of range development in the eastern mountainous region. Any sites found within the footprint during systematic pedestrian surveys will be evaluated for NRHP eligibility. Further mitigation will depend on site eligibility and the possibility of avoiding sites by adjusting the boundaries of the planned undertaking.

APPENDIX 1: Determinations of Eligibility for Seven Sites

DETERMINATION OF ELIGIBILITY

AHRS #	FAI-02043	Date	04/10/2012	
Site Name	Blair Lakes A-10-4	UTM		
Determination	Eligible	Location	Blair Lakes Region, Tanana Flats Training Area, Fort Wainwright, Alaska	

Classification of Property

Ownership	USAG FWA	Category	Site	Number of Resources	1
-----------	----------	----------	------	---------------------	---

Property Description

Summary

FAI-02043 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. Two separate components produced radiocarbon dates indicating late Pleistocene and middle Holocene occupations. Charcoal was found in association with lithic debitage in both components. Mammal bone fragments, including bison, occurred in the lower component.

Description and Historic Context

Site FAI-02043 is located at the foot of a large bedrock knoll, roughly seven kilometers east of the Blair Lakes (Figure 1). Site elevation is 260 masl. The vantage point provides a commanding view to the east of the flats below, the Tanana River valley and Flag Hill. The ecosystem is characterized as mixed needleleaf-broadleaf forest with an understory of young birch, some alder, shrubs and forbs. This site was identified through subsurface testing. At the time of discovery, 94 flakes were recovered from four of four test pits excavated. Two of these tests also yielded unidentifiable large mammal faunal fragments. Shovel testing suggested that the site contained at least two components: one at ~0-45 cm BS, and another deeply buried in the lower loess and basal sands at 90-120 cm BS. Three of the four test pits, those nearest the edge of the landform, reached basal gravels at 100-130 cm BS, while one test pit (AT 50) was excavated to the depth possible with a shovel, terminating at 140 cm BS without finding the bottom of the basal sands.

To understand the significance of the site, 2 square meters was excavated to a depth of about 135 cm BS. A total of 14 levels were excavated, extending the excavation roughly 35 cm into the basal sands and at least 15 cm deeper than the lowest recovered artifact. Levels 1-5 of the excavation unit produced no cultural remains. Artifacts were recovered from Levels 6-13. The basal level, Level 14, was 25 cm thick and excavated into entirely sterile deposits. Figures 2 shows the location of lithics and bone in each excavation level. A total of 1106 pieces of lithic debitage and 538 faunal fragments were recovered from the excavation unit. In addition, two cobble hammerstones, and at least four enigmatic angular rocks, likely manuports, were recovered from the lower zone of cultural material. Lithic and faunal material was recovered from depths of 10-30 cm BS and 75 to 125 cm BS (Figure 3).

No diagnostic artifacts were found at the site, but stone tool making debris was found with charcoal and large mammal remains (including bison (Figure 4)). Test pit AT 50 provided a piece of charcoal associated with flaked stone roughly 2 cm above the loess/sand contact that dated to 10,730 ± 50 14C Years BP (Beta-281235), demonstrating the antiquity of the lower component. Dispersed charcoal found in association with flakes in the upper component at 22 cm BS produced a date of 6460 ± 40 (Beta-283427) revealing the presence of a middle-Holocene occupation.

While the sample from FAI-02043 is limited thus far, several robust inferences are possible. Cultural zone (CZ) 2 is coeval with Upward Sun River component C1, Broken Mammoth component CZ 4, the lowest Mead components, Swan Point CZ4, and four components in the Nenana Basin (Goebel et al. 1996; Goebel and Bigelow 1996; Hoffecker 1996; Holmes 1996; Pearson 1997; Potter et al 2008; 2011). The character of the lithic and faunal assemblages from this site is most similar to Broken Mammoth CZ 4 and Upward Sun River C1 with abundant lithic debitage and few formal tools. The presence of large and small game and waterfowl is also very similar to the Upward Sun River C1 and Broken Mammoth CZ 4 faunal assemblages and provides further evidence of broad-spectrum hunting strategies in late Pleistocene Eastern Beringia. The long bone breakage patterns and associated cobbles indicate marrow extraction. The presence of waterfowl suggests an early summer to fall occupation.

AHRS # FAI-02043

Statement of Significance

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinct characteristics of a type, period, or method of construction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance Archaeology: prehistoric

Period of Significance Two occupations:
Late Pleistocene: 10,730 ± 50 14C Years BP (Beta-281235)
Middle Holocene: 6460 ± 40 (Beta-283427)

Cultural Affiliation American Palaeoarctic, Northern Archaic

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located on a terrace edge to the northeast of the Blair Lakes Archaeological District. Artifacts, faunal material, and charcoal are buried in stratigraphic context and there is no evidence that their spatial organization has been disturbed since deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far are not diagnostic in themselves but are significant when associated with faunal material and charcoal. Moreover, artifacts are found in good association with datable material and cultural layers were found separated by several centimeters of sterile sediments.

Research Potential FAI-02043 has a high research potential. Humans began to populate North America in the late Pleistocene, likely not much earlier than 14,000 calendar years BP (Goebel et al 2008). The earliest sites in Alaska (Swan Point and Mead; Holmes 1996) are found in the Tanana Valley between the Blair Lakes region and Delta Junction. There is tremendous variability in projectile point style and lithic assemblage composition in sites dating to this period across Alaska (Bever 2001). The radiocarbon date from the lower component at FAI-02043 places this site within the time period of Nenana Complex sites (12,800 calendar years ago). The deep stratigraphy and association of faunal material, lithic tools, and charcoal at this site suggests a significant potential to play into research problems dealing with the Peopling of the Americas, Alaskan assemblage variability, and early landscape use patterns in the Tanana Valley. The fauna collection is rich and provides evidence for questions about hunting strategies in late Pleistocene Eastern Beringia. Because it is a multi-component site with good stratigraphic separation between occupations, analysis of the cultural materials will also help in defining culture-historical frameworks for Alaska.

Summary FAI-2043 is eligible under Criterion D in the area of prehistoric archaeology. This site is one in less than a few dozen sites in Alaska dating to the late Pleistocene. It has the potential to provide information regarding early human subsistence, land use, and technological strategies during the earliest human history in North America as well as for the later Northern Archaic period. Deep, stratified, multi-component sites such as FAI-2043 are rare in Alaska and this site has high potential for yielding important information about diet, tool stone procurement, and stone tool production methods.

Geographical Data

Acreage of Property unknown

Boundary Description Site boundaries have not been determined, but are potentially extensive. Cultural deposits could occur across the entire 20,000 square meter flat area on the top of the landform.

Other Information

Other Information This site should be included as a contributing site to the Blair Lakes Archaeological District.

DETERMINATION OF ELIGIBILITY

AHRS #	FAI-02047	Date	04/10/2012	
Site Name	Blair Lakes A-10-8	UTM		
Determination	Eligible	Location	Blair Lakes Region, Tanana Flats Training Area, Fort Wainwright, Alaska	

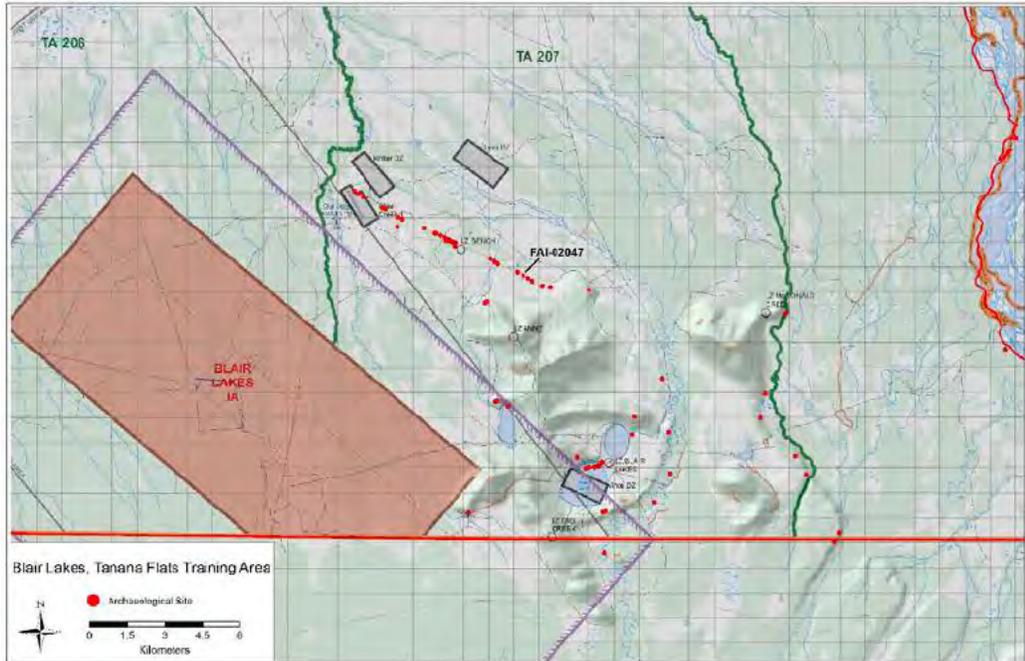

Classification of Property

Ownership	USAG FWA	Category	Site	Number of Resources	1
-----------	----------	----------	------	---------------------	---

Property Description

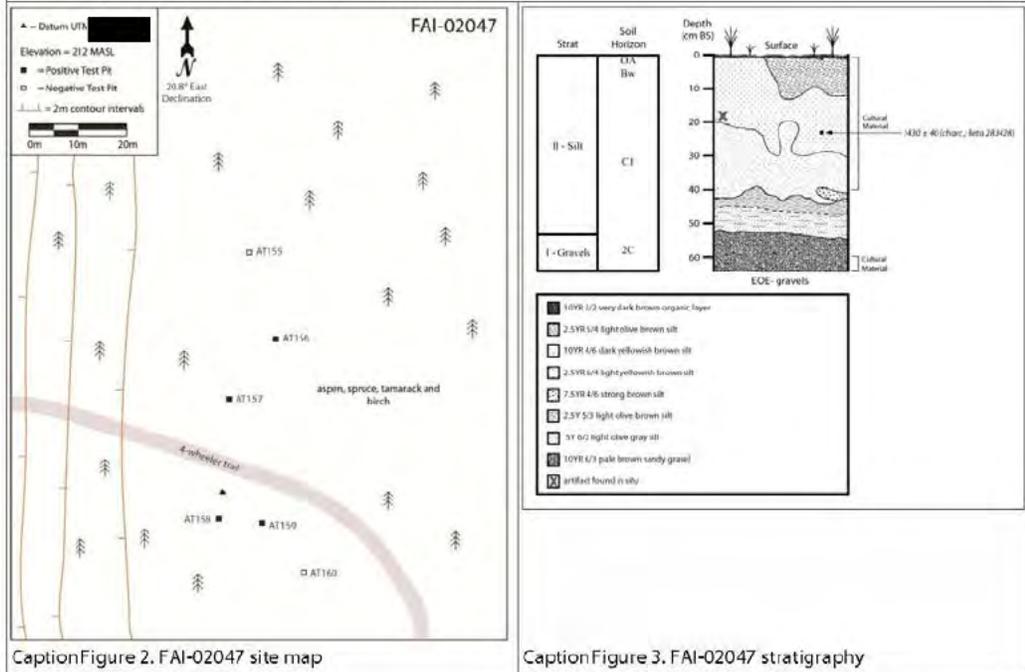

Summary	<p>FAI-02047 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. Charcoal, found in association with lithic debitage and bone fragments, produced radiocarbon dates indicating a late Holocene occupation.</p>
---------	--

Description and Historic Context	<p>Site FAI-02047 is located on a glacial outwash terraced bench at 212 masl (Figure 1). The site overlooks a substantial drainage to the west and the Tanana River valley to the south and southeast. The terrace slopes gradually north-south and west-east at 0°-5°, with sharper slopes on its southern and western edges (15°-25°). The terrace is elevated approximately 10-12 m above both the drainage and the valley. A dirt two-track rises from the drainage and cuts across the site near the terrace southern terminus (Figure 2).</p> <p>The ecosystem is characterized as upland moist mixed needle/broadleaf forest. Site vegetation consists of mature aspen and mixed aged spruce and birch. The understory is alder, wild rose and low scrub, with a dense moss and lichen ground cover. Surface exposure across the site is generally 0%, with the exception of the two track roadbed and shoulder, where surface visibility is 100%.</p> <p>Site FAI-02047 was found through subsurface testing. Cultural material was recovered from four of the six 50 cm x 50 cm test pits excavated. A total of 13 lithic artifacts were recovered at depths ranging from surface-65 cm BS. A microblade medial fragment was recovered from one test pit at 60-65 cm BS (Figure 4). Four calcined bone fragments were recovered from a test pit at depths ranging from 0-16 cm BS. All of these were small unidentifiable fragments less than 7 cm in diameter. Stratigraphic charcoal found in association with the cultural material produce an AMS 14C date of 1430 ± 40 B.P. (Beta-283428).</p> <p>Site stratigraphy consists of aeolian silts at least 50 cm thick overlying poorly sorted sandy gravels extending at least 75 cm BS (Figure 3).</p>

AHRS # FAI-02047

Statement of Significance

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinct characteristics of a type, period, or method of construction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance Archaeology: prehistoric

Period of Significance Late Holocene 1430 ± 40 14C Years BP (Beta-283428)
One older undated occupation

Cultural Affiliation Athabaskan

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located near the Blair Lakes Archaeological District, along a terrace edge to the northwest. Artifacts, faunal material, and charcoal are buried in situ in stratigraphic context, and therefore, their spatial organization has not been substantially disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far are not diagnostic in themselves but are significant when associated with faunal material and charcoal. Moreover, artifacts are found in good association with datable material and cultural layers were found separated by several centimeters of sterile sediments.

Research Potential FAI-02047 has a high research potential. The late Holocene radiocarbon dates and intact stratigraphy make the site integral to discussions of early Athabaskan land use patterns in the Tanana Valley. Recent research in the connections between Athabaskan language groups (Na-Dene) and Siberian languages (Ket) (e.g. Kari and Potter 2010) has prompted researchers to attempt to trace Athabaskan material culture further back in time. Most of what is known about Athabaskan archaeology comes from late Prehistoric village sites dating back only to the last few hundred years. Sites such as Dithada (Raine 1939, Shinkwin 1979), Klokut (Morlan 1973), and Ringling (Hansen 2008) demonstrate people were subsisting off of seasonally abundant resources (i.e. caribou and salmon) and that birch bark, cobble spall scrapers, tanged arrow points, and local metals were important toolkit items. Sites in Interior Alaska such as U.S. Creek and Cripple Creek (Esdale and Mills 2010, Smith 2012) have begun to trace these items back into the last millennium before present. Dated sites such as FAI-02047 will be extremely significant for making connections between modern Athabaskan people and prehistoric sites.

Summary FAI-2047 is eligible under Criterion D in the area of prehistoric archaeology. Stratified and dated Athabaskan archaeological sites are rare in Interior Alaska. FAI-02047 contains artifacts, faunal material, and charcoal buried in stratigraphic context. The site has the potential to provide significant information regarding past Athabaskan lifeways and material culture, and will provide an important link between a prehistoric archaeological site and historic people living in the region.

DETERMINATION OF ELIGIBILITY

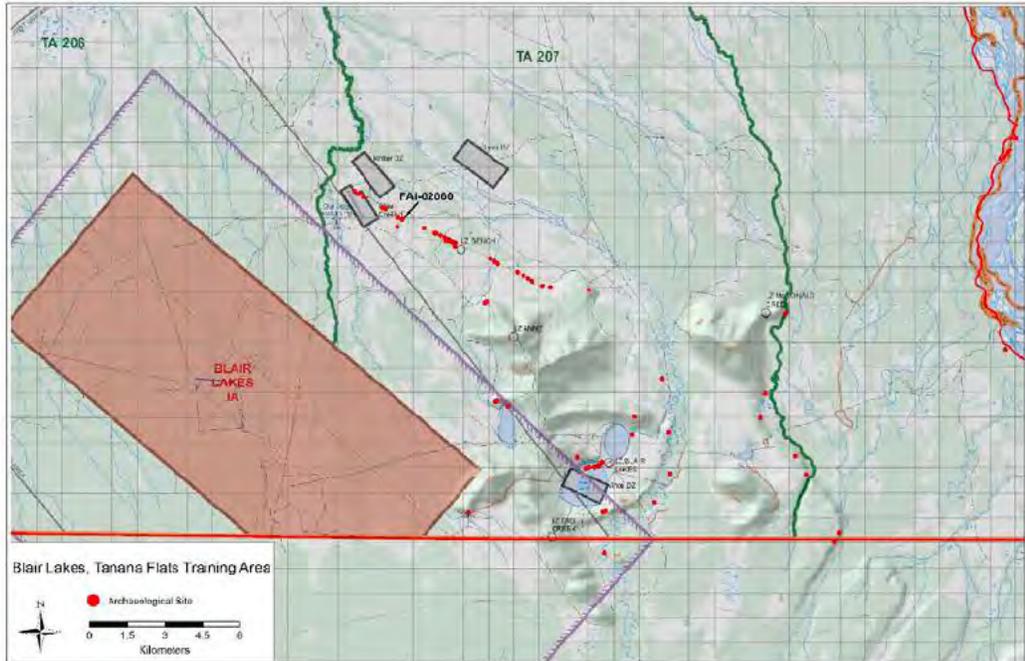

AHRS #	FAI-02060	Date	04/10/2012	
Site Name	Blair Lakes A-10-21	UTM		
Determination	Eligible	Location	Blair Lakes Region, Tanana Flats Training Area, Fort Wainwright, Alaska	

Classification of Property

Ownership	USAG FWA	Category	Site	Number of Resources	1
-----------	----------	----------	------	---------------------	---

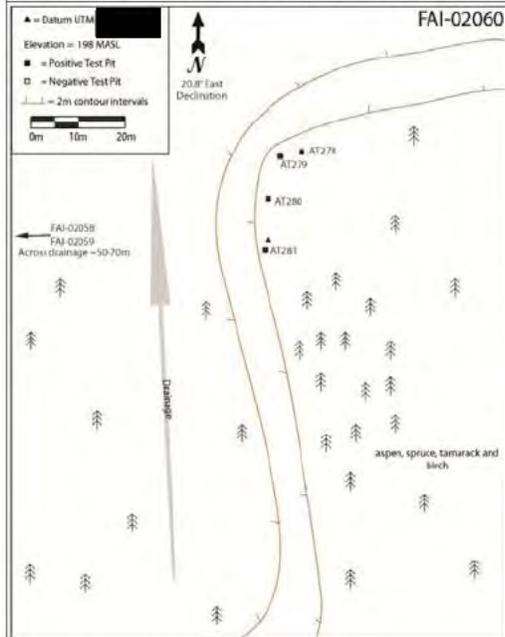

Property Description

Summary	<p>FAI-02060 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. This site has two cultural components. Charcoal, found in association with lithic debitage, produced a radiocarbon date for the lower assemblage indicating an early Holocene occupation.</p>
Description and Historic Context	<p>Site FAI-02060 is located on a north-facing terrace edge at an elevation of 198 masl (Figure 1). The site overlooks a large north-south drainage to the west and the Tanana River valley to the north. The terrace is approximately 10-12 meters above the drainage and the valley; a 15° slope leads down to both. East and southeast of the site, the terrain gradually slopes up to the crest of the landform 45 meters east of the site datum. The terrace provides an excellent viewshed of the Tanana River valley and the Dry Creek drainage to the north. Dry Creek is the nearest water source, and several unnamed, seasonal creeks cut through the outwash bench at closer locations (Figure 2).</p> <p>The ecosystem is characterized as upland moist needleleaf forest. Site vegetation consists of dense low spruce thickets, mature aspen, and mixed-aged birch. The understory is alder, willow, wild rose, and low scrub, with a dense moss and lichen ground cover. Surface exposure is 0%.</p> <p>Site FAI-02060 was initially identified by a single retouched flake found on the surface near the western terrace edge (Figure 4). Subsequent subsurface excavations produced cultural material from all four 50 cm x 50 cm test pits excavated. A total of 34 lithic artifacts were recovered from test pits at depths ranging from 0-37 cm BS.</p> <p>Dispersed charcoal associated with cultural material at 29 cm BS produced an AMS 14C date of 8130 ± 40 (Beta-283429).</p> <p>Site stratigraphy consists of aeolian silts 45-55 cm thick overlying a thick gravel layer extending to at least 65 cm BS (Figure 3).</p>

Statement of Significance

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinct characteristics of a type, period, or method of construction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance Archaeology: prehistoric

Period of Significance Early Holocene: 8130 ± 40 14C Years BP (Beta-283429)

Cultural Affiliation American Palaeoarctic/Denali

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located near the Blair Lakes Archaeological District, on a terrace edge to the northwest. Artifacts and charcoal are buried in situ in stratigraphic context, and therefore, their spatial organization has not been substantially disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far are not diagnostic in themselves but are significant when associated with charcoal.

Research Potential FAI-02060 has a high research potential. Although early Holocene archaeological sites are known from Alaska (e.g. Potter 2008), they are rarely the focus of academic research, being overshadowed by the hunt for the earliest sites in North America on the early end of the spectrum, and the highly visible Northern Archaic during the middle Holocene. Little is known about early Holocene assemblage variability for sites in Interior Alaska. There appears to be significant continuity in stone tool forms throughout the Holocene (Esdale 2008, Potter 2008), and much more variability in the interior in earlier dated assemblages (Bever 2001). Sites dating to this time period are either called "American Palaeoarctic" (in northwest Alaska) or "Denali" (interior Alaska) (Hoffecker 2001), and are characterized in both instances by heavy use of microblade technology. No microblades have been discovered thus far at FAI-02060. The site, with its buried cultural material in stratigraphic context with associated charcoal, has potential to address research questions concerning assemblage variability and site use as well as to contribute to cultural-historical reconstructions.

Summary FAI-02060 is eligible under Criterion D in the area of prehistoric archaeology. Stratified, multi-component sites, are rare across Alaska. Cultural-historical frameworks depend on repeated associations of toolkit elements in stratified sites. This site has the potential to provide information regarding early Holocene tool production strategies and assemblage compositions as well as yield important information about land and tool use patterns over time.

DETERMINATION OF ELIGIBILITY

AHRS #	FAI-02063	Date	04/10/2012	
Site Name	Blair Lakes B-10-2	UTM		
Determination	Eligible	Location	Blair Lakes Region, Tanana Flats Training Area, Fort Wainwright, Alaska	

Classification of Property

Ownership	USAG FWA	Category	Site	Number of Resources	1
-----------	----------	----------	------	---------------------	---

Property Description

Summary

FAI-02063 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. A lanceolate projectile point was found in the lower silt levels that are coeval to similar levels with late Pleistocene dates at other nearby sites.

Description and Historic Context

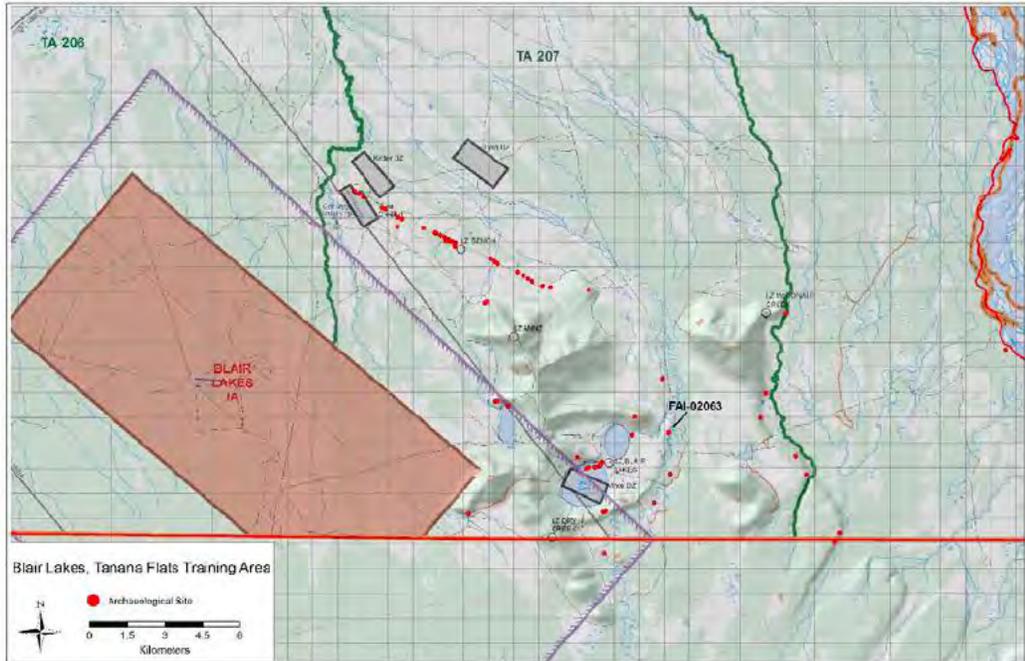

Site FAI-02063 is located on a north-south trending terrace edge approximately 1.5 km east-northeast of Blair Lake North (Figure 1). Site elevation is 273 masl. The terrace is elevated approximately 25 m above Dry Creek, which is the nearest source of water. The eastern terrace drops down to Dry Creek at approximately 40°. The slope to the west is much more gradual, 5-10°, but continues for at least 60 m. The site sits at a point on the terrace edge which protrudes 2-3 m to the east. This point provides a 180° view of Tanana Flats below. Pork Chop Lake can be seen directly east approximately 2 km away (Figure 2).

The ecosystem is characterized as upland moist mixed broadleaf/needleleaf forest. The vegetation consists of spruce, aspen, rose, bearberry, low scrub, moss and lichen. The surface exposure is on average 50% with visibility higher near the eroding terrace edge.

Site FAI-02063 was found through subsurface testing. Three 50 cm x 50 cm shovel tests were excavated, one of which contained cultural material (Figure 3). Cultural material was recovered from 35-60 cm BS. The site consists of 11 chert flakes and one broken chert projectile point (Figure 4). The flakes were dispersed from 35-60 cm BS and the projectile point was recovered from 50-55 cm BS.

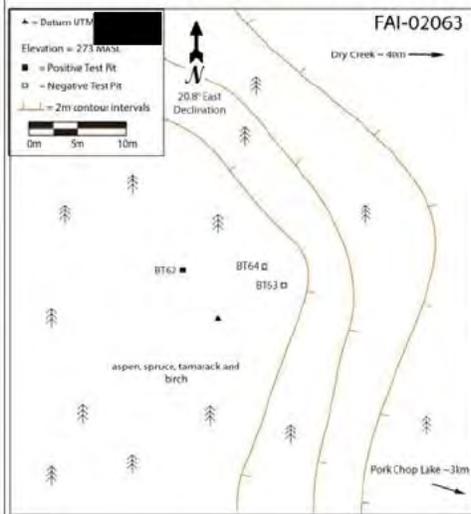

Site stratigraphy consists of aeolian silts and sands at least 44 cm thick overlying basal poorly sorted sandy gravels.

Although no charcoal was found with the artifacts at the site, the location of the artifacts in the stratum indicating a late Pleistocene age elsewhere on the terrace system (FAI- 02043, FAI-02077) suggests that the artifacts, including the lanceolate projectile point fragment, may be of equal antiquity.

Statement of Significance

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinct characteristics of a type, period, or method of construction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance Archaeology: prehistoric

Period of Significance Late Pleistocene

Cultural Affiliation American Palaeoarctic/Nenana

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located on a terrace edge to the northeast the Blair Lakes Archaeological District. Artifacts are buried in situ in stratigraphic context and their spatial organization does not appear to have been disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. The lanceolate projectile point found is consistent with spear points from other sites in Alaska dating to the late Pleistocene and early Holocene. Though the artifacts excavated thus far may not be diagnostic in themselves, they are significant when considered with their stratigraphic context.

Research Potential FAI-02063 has a high research potential. Humans began to populate North America in the late Pleistocene, likely not much earlier than 14,000 calendar years BP (Goebel et. al 2008). The earliest sites in Alaska (Swan Point and Mead; Holmes 1996) are found in the Tanana Valley between the Blair Lakes region and Delta Junction. There is tremendous variability in projectile point style and lithic assemblage composition in sites dating to this period across Alaska (Bever 2001). The stratigraphic position of the lanceolate point and other lithic artifacts at this site compared with nearby terrace sites FAI-02043 and FAI-02077 infers a late Pleistocene age of this site within the time period of other Nenana Complex sites from the Tanana Valley. The deep stratigraphy and associated artifacts at this site have significant potential to play into research problems dealing with the Peopling of the Americas, Alaskan assemblage variability, and early landscape use patterns in the Tanana Valley.

Summary FAI-02063 is eligible under Criterion D in the area of prehistoric archaeology. The archaeology of the late Pleistocene in Alaska is known from very few sites. Other sites with similar stratigraphic profiles have produced radiocarbon dates older than 10,000 years BP with associated lithic and faunal material. A single test pit at FAI-02063 contained flakes and a broken projectile point in the lowermost terrace silt level and may hold more evidence of early human occupation in the Blair Lakes region. FAI-02063 also has the potential to provide information regarding early human subsistence, land use, and technological strategies during the earliest human history in North America.

Property Description

Summary

FAI-02064 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. Charcoal, found in association with lithic debitage and bone fragments, produced radiocarbon dates indicating a late Holocene occupation.

Description and Historic Context

Site FAI-02064 is located on the crest of bedrock knoll north of Blair Lakes (Figure 1). Site elevation is 351 masl. The view from the crest is 360°. Blair Lake North, the closest source of water, can be seen approximately 500 m to the southeast. The slopes to the northeast and southwest are approximately 30°, and the slopes to the northwest and southeast are approximately 15°. The highest point of the crest (approximately 40 m northwest-southeast by 15 m northeast-southwest) has been mechanically scraped. Push piles line the southern edge of the disturbance.

The ecosystem is characterized as upland dry needleleaf/broadleaf forest. Vegetation consists of mature aspen and spruce with an understory of fireweed, rose, low bush cranberry, moss, and lichen. Surface visibility is 0-10%.

Site FAI-02064 was found through subsurface testing. Five 50 cm by 50 cm test pits were excavated (Figure 2). Two test pits contained cultural material consisting of 70 lithic flakes 0-45 cm BS, two microblades at 10-33 cm BS (Figure 4), and one burin spall at 35 cm BS.

Dispersed charcoal found in association with cultural material at 40 cm BS produce an AMS 14C date of 2170 ± 40 (Beta- 283435).

Site stratigraphy consists of aeolian silts at least 38 cm thick overlying decaying schist bedrock (Figure 3).

AHRS # FAI-02064

Statement of Significance

- A. Property is associated with events that have made a significant contribution to the broad patterns of our history.
- B. Property is associated with the lives of persons significant in our past.
- C. Property embodies the distinct characteristics of a type, period, or method of construction.
- D. Property has yielded, or is likely to yield, information important in prehistory or history.

Areas of Significance Archaeology: prehistoric

Period of Significance Late Holocene: 2170 ± 40 14C Years BP (Beta- 283435)

Cultural Affiliation Athabaskan

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located near the Blair Lakes Archaeological District, along a terrace edge to the northwest. Artifacts, faunal material, and charcoal are buried in situ in stratigraphic context, and therefore, their spatial organization has not been substantially disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far, such as the microblades, are not diagnostic for a particular time period in themselves, but are significant when associated with the datable material.

Research Potential FAI-02064 has a high research potential. The late Holocene radiocarbon dates and intact stratigraphy make the site integral to discussions of early Athabaskan land use patterns in the Tanana Valley. Recent research in the connections between Athabaskan language groups (Na-Dene) and Siberian languages (Ket) (e.g. Kari and Potter 2010) has prompted researchers to attempt to trace Athabaskan material culture further back in time. Most of what is known about Athabaskan archaeology comes from late Prehistoric village sites dating back only to the last few hundred years. Sites such as Dithada (Raihey 1939, Shinkwin 1979), Klokut (Morlan 1973), and Ringling (Hansen 2008) demonstrate people were subsisting off of seasonally abundant resources (i.e. caribou and salmon) and that birch bark, cobble spall scrapers, tanged arrow points, and local metals were important toolkit items. Sites in Interior Alaska such as U.S. Creek and Cripple Creek (Esdale and Mills 2010, Smith 2012) have begun to trace these items back into the last millennium before present. Dated sites such as FAI-02064 will be extremely significant for making connections between modern Athabaskan people and prehistoric sites.

Summary FAI-2064 is eligible under Criterion D in the area of prehistoric archaeology. Stratified and dated Athabaskan archaeological sites are rare in Interior Alaska. FAI-02064 contains artifacts and charcoal buried in stratigraphic context. The site has the potential to provide significant information regarding past Athabaskan lifeways and material culture, and will provide an important link between a prehistoric archaeological site and historic people living in the region.

Property Description

Summary

FAI-02073 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK.

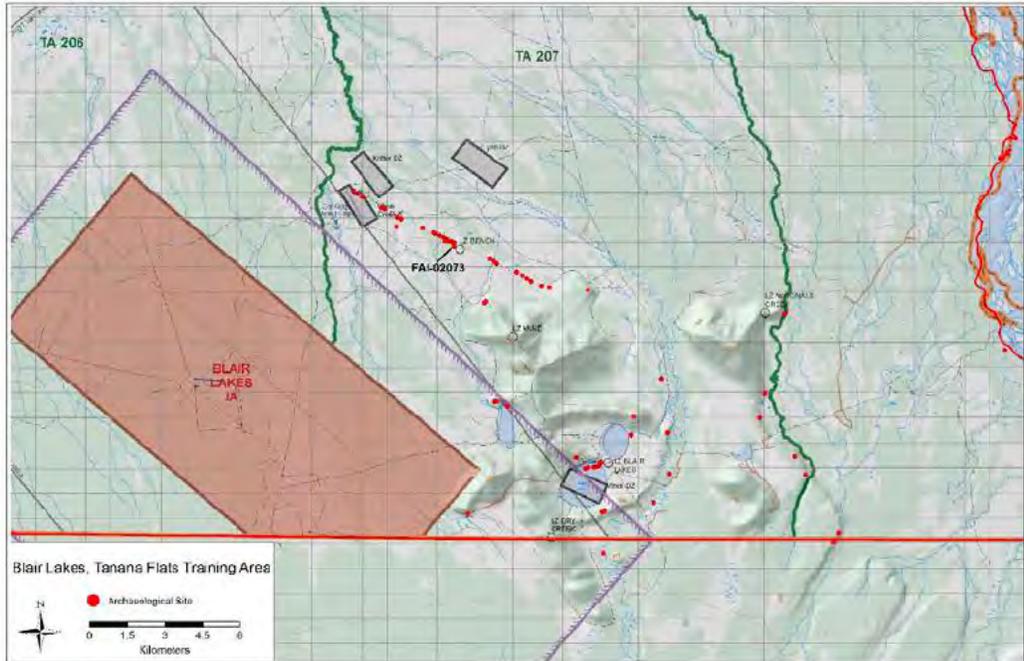

Description and Historic Context

Site FAI-02073 is located on the edge of a north-facing alluvial terrace that is elevated approximately 15 m above the tussocks and valley floor below (Figure 1). Site elevation is 213 masl. The highest point of the terrace is approximately 80 m north-south and 40 m east-west. Two unnamed drainage channels converge 20 m directly north of FAI-02073 to become the main water source in the area which flows northeast to the Tanana Flats. The viewshed from the northern tip of the landform is roughly 270°.

The ecosystem is characterized as upland moist needleleaf forest. Vegetation consists mainly of young spruce, tamarack, and willow with an understory of moss and lichen. Surface visibility is less than 5%.

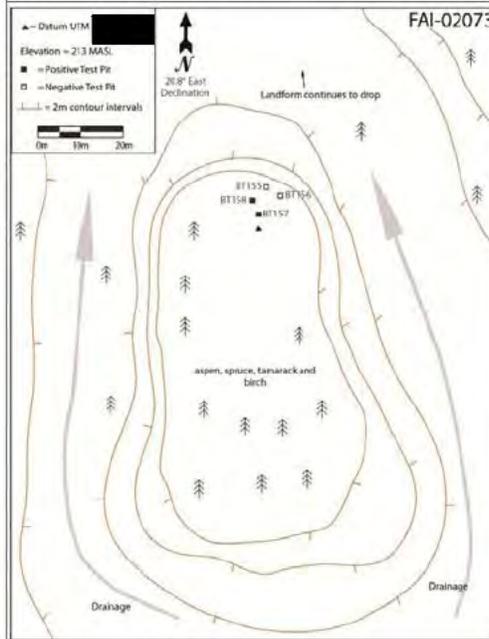

Site FAI-02073 was found through subsurface testing. Four 50 cm x 50 cm test pits were excavated (Figure 2). Two test pits contained cultural material, including 30 pieces of lithic debitage recovered from 0-45 cm BS (Figure 3). Two microblades, one microblade core (Figure 4) was found in situ at 45 cm BS, and one microblade core tab were recovered from 0-40 cm BS.

Site stratigraphy consists of aeolian silts at least 46 cm deep overlying poorly sorted basal sandy gravels (Figure 3).

Areas of Significance Archaeology: prehistoric

Period of Significance Late Pleistocene

Cultural Affiliation American Palaeoarctic/Nenana/Denali

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located on a terrace edge to the northeast of the Blair Lakes Archaeological District. Artifacts including microblades and microblade cores are buried in stratigraphic context and their spatial organization does not appear to have been disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far are diagnostic of several time periods in Alaska, but paired with their stratigraphic position in the site, in a similar location to the lowermost cultural layer at FAI-02043 and FAI-02077, they appear to belong to the late Pleistocene.

Research Potential FAI-02073 has a high research potential. Humans began to populate North America in the late Pleistocene, likely not much earlier than 14,000 calendar years BP (Goebel et. al 2008). The earliest sites in Alaska (Swan Point and Mead; Holmes 1996) are found in the Tanana Valley between the Blair Lakes region and Delta Junction. There is tremendous variability in projectile point style and lithic assemblage composition in sites dating to this period across Alaska (Bever 2001). The stratigraphic position of the microblade core and associated lithic artifacts at this site compared with nearby terrace sites FAI-02043 and FAI-02077 infers a late Pleistocene age of this site within the time period of other Nenana Complex sites from the Tanana Valley. The deep stratigraphy and associated artifacts at this site have significant potential to play into research problems dealing with the Peopling of the Americas, Alaskan assemblage variability, and early landscape use patterns in the Tanana Valley.

Summary FAI-02073 is eligible under Criterion D in the area of prehistoric archaeology. The archaeology of the late Pleistocene in Alaska is known from very few sites. Other sites with similar stratigraphic profiles have produced radiocarbon dates older than 10,000 years BP with associated lithic and faunal material. Two test pits at FAI-02073 contained flakes, microblade core related debitage, and a microblade core in the lowermost terrace silt level and may hold more evidence of early human occupation in the Blair Lakes region. FAI-02073 also has the potential to provide information regarding early human subsistence, land use, and technological strategies during the earliest human history in North America.

Ownership Category Number of Resources

Property Description

Summary

FAI-02077 is a buried, intact, archaeological site located in the Blair Lakes Region of the Tanana Flats Training Area, south of Fairbanks, AK. Charcoal found in deeply stratified deposits with cultural material dated to the late Pleistocene.

Description and Historic Context

Site FAI-02077 is located on a north-facing terrace edge northwest of Blair Lakes (Figure 1). Site elevation is 213 masl. The site is located to the west of a narrow unnamed drainage channel runs into the flats below. The landform slopes approximately 45° to the northeast into the flats roughly 15 m below. The Fairbanks hills can be seen to the northeast, Clear Creek Buttes can be seen approximately 25 km away to the northwest at 326°, and the outline of Dry Creek can be seen approximately 3 km to the north.

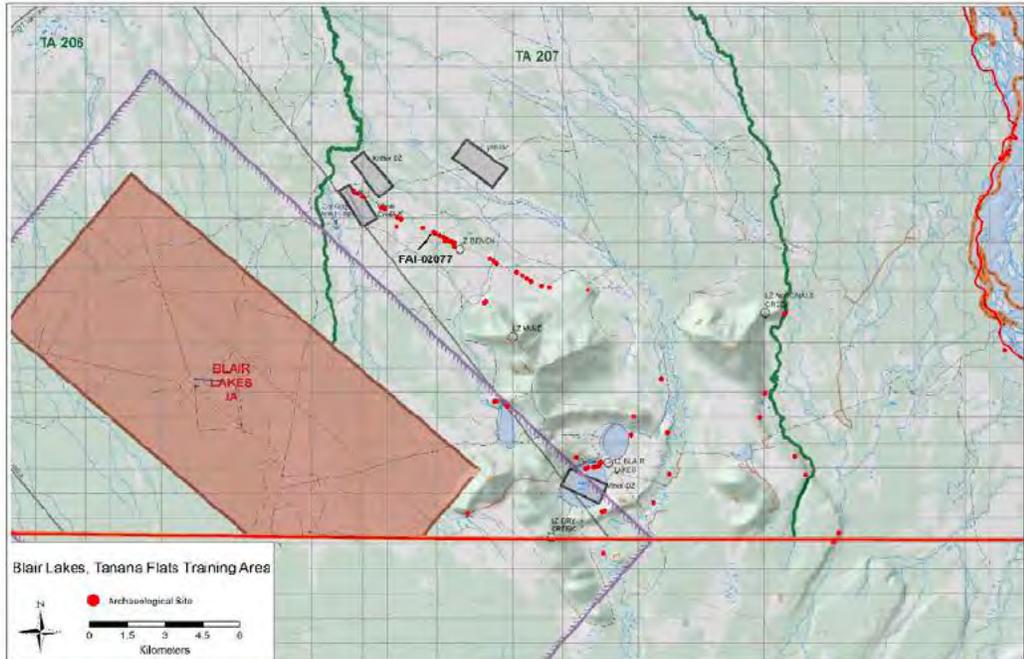

The ecotype is described as upland moist mixed broadleaf/needleleaf forest. Vegetation consists of birch, tamarack, and spruce with an understory of moss mushrooms and lichen. Surface visibility is 10-20%. Moderate bioturbation (animal dens) located in the northeast corner.

Site FAI-02077 was found through subsurface testing. Seven 50 cm x 50 cm test pits were excavated (Figure 2). One test pit contained cultural material, including one 10-20 mm dark gray (7.5YR 4/1) chert flake fragment, one rhyolite biface, and one chert microblade (Figure 3, Figure 4) recovered from 20-30 cm BS.

Dispersed charcoal associated with cultural material at a depth of 31 cm BS produced an AMS 14C date of 10130 ± 50 (Beta-283435).

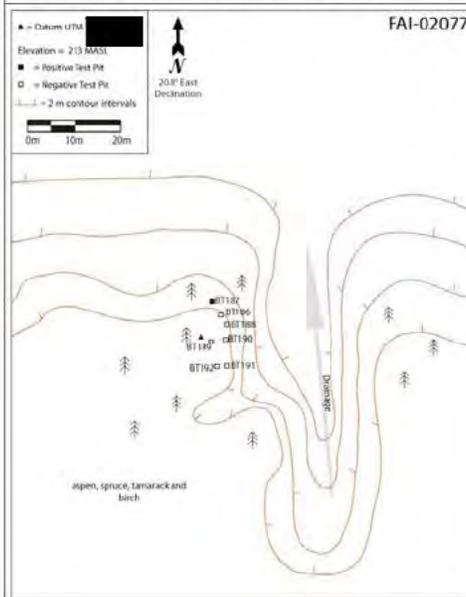

Site stratigraphy consists of aeolian silts at least 145 cm thick. No underlying basal stratigraphy was encountered (Figure 3).

Cultural Affiliation American Palaeoarctic

Level of Significance Regional and state

Criteria Considerations This property retains high integrity in the areas of location, design, setting, materials, and association. This site is located near the Blair Lakes Archaeological District, on a terrace edge to the northeast. Artifacts, including microblades, and charcoal are buried in situ in stratigraphic context, and therefore, their spatial organization has not been substantially disturbed since original deposition. The site is located in a prominent area with a good view of the surrounding territory, ideal for watching for prey species. Artifacts excavated thus far are not diagnostic in themselves but are significant when associated with charcoal.

Research Potential FAI-02077 has a high research potential. Humans began to populate North America in the late Pleistocene, likely not much earlier than 14,000 calendar years BP (Goebel et al 2008). The earliest sites in Alaska (Swan Point and Mead; Holmes 1996) are found in the Tanana Valley between the Blair Lakes region and Delta Junction. There is tremendous variability in projectile point style and lithic assemblage composition in sites dating to this period across Alaska (Bever 2001). The radiocarbon date from the lower component at FAI-02077 places this site within the time period of Nenana Complex sites (12,200 calendar years ago). The deep stratigraphy and association of faunal material, lithic tools, and charcoal at this site suggests a significant potential to play into research problems dealing with the Peopling of the Americas, Alaskan assemblage variability, and early landscape use patterns in the Tanana Valley. The fauna collection is rich and provides evidence for questions about hunting strategies in late Pleistocene Eastern Beringia. Because it is a multi-component site with good stratigraphic separation between occupations, analysis of the cultural materials will also help in defining culture-historical frameworks for Alaska.

Summary FAI-02073 is eligible under Criterion D in the area of prehistoric archaeology. This site is one in less than a few dozen sites in Alaska dating to the late Pleistocene. It has the potential to provide information regarding early human subsistence, land use, and technological strategies during the earliest human history in North America as well as for the later Northern Archaic period. Deep, stratified, multi-component sites such as FAI-02073 are rare in Alaska and this site has high potential for yielding important information about diet, tool stone procurement, and stone tool production methods.

AHRS # FAI-02077

APPENDIX 4: Section 106 Undertakings 2010 and 2011 (*Cold Regions Test Center projects)

Project Name	Undertaking	Location	Survey Date	Acres Surveyed	Sites Found
Golf Course Club House	Ground breaking for building construction	FWA Cantonment	5/2010	20	None
Mountain Bike Trails	Vegetation removal and ground disturbance	FWA Cantonment	5/2010	3	None
TA 113 B Maneuver Trails	Vegetation removal and trail grading	FWA Cantonment	6/2010	67	None
Firing Point 2014 Enhancement	Vegetation thinning and site hardening	Yukon Training Area	6/2010	2.3	None
Skyline-Beaver Maintenance	Vegetation removal and trail grading	Yukon Training Area	5/2010	68	None
TA 108 Soil Stockpile	Soil storage	FWA Cantonment	6/2011	225	FAI-02117
CRREL Power Line Expansion	Excavation for power poles	Farmer's Loop Locality	7/2011	25	None
Birch Hill Ski Trail Development	Trail maintenance and vegetation removal	FWA Cantonment	7/2011	1200	None
IEDD Operations Building	Ground breaking for building construction	FWA Cantonment	7/2011	7	None
Quarry Borrow Pit Expansion	Soil and gravel quarry excavation	Yukon Training Area	7/2011	6	None
Quarry Road Timber Sales	Tree removal	Yukon Training Area	7/2011	178	None
Dyke Range Timber Sales	Tree removal	Dyke Range	7/2011	20	None
Lampkin Range Expansion	Vegetation removal and ground disturbance	Donnelly Training Area	7/2011	4	None
Buffalo Drop Zone Timber Sales	Tree removal	Donnelly Training Area	7/2011	779	None
33 Mile Loop Connector Trail	Vegetation removal and ground disturbance	Donnelly Training Area	7/2011	116	None
Johnson Road Timber Sales	Tree removal	Yukon Training Area	9/2011	64	None
Transmitter Road Timber Sales	Tree removal	Yukon Training Area	9/2011	264	None
South Quarry Road Timber Sales	Tree removal	Yukon Training Area	8/2011	1903	None
Beaver Creek Road Trail Maintenance	Vegetation removal and ground disturbance	Yukon Training Area	8/2011	294	XBD-00387
Greely Approach Timber Sales	Tree removal	Donnelly Training Area	8/2011	66	None
33 Mile Loop Trail Maintenance	Vegetation removal and ground disturbance	Donnelly Training Area	8/2011	75	None
Gerstle River Training Area Timber Sales	Tree removal	Gerstle River Training Area	8/2011	25	None
CRREL Permafrost Facility	Ground disturbance for new tunnel	CRREL Facility, Steese Highway	7/2011	12	None
Washington Range Trail Renovation*	Vegetation removal and ground disturbance	Donnelly Training Area	6-8/2011	1280	XMH-01455, XMH-01456, XMH-01458, XMH-01459, XMH-01460
OP Road Fiber Optic Cable Installation*	Vegetation removal and ground disturbance	Donnelly Training Area	8/2011	132	XMH-01457
OPI2 Access Road*	Vegetation removal and ground disturbance	Donnelly Training Area	8-9/2011	700	None
Direct Fire Line*	Vegetation removal and ground disturbance	Donnelly Training Area	8/ 2011	53	None
